Simply put: There are 128 memory slots available in the radio's memory. The A: display can show what is in one of those slots while the B: display can show what is in the same or any other slot. UHF/VHF have no relationship to displays A: or B:. Furthermore any memory slot can hold either a VHF or an UHF transmit and/or receive frequency. What the Baofeng does have is the somewhat confusing ability to do cross-band operation, that is you do not have to have the same frequency as receive and you do transmit in the same memory slot. With the Baofeng the "split" can be the "USofA standard" 600 MHz for VHF or 5 MHz for UHF repeaters or any other split suitable for your system including UHF to VHF splits or vice-versa.

That said, the band button might better be labeled display as it toggles the active channel from the A: display to the B: display. Since I have an older UV-5R I'm not sure off the top of my head what key(s) do toggle the display on your model.

You can't figure it out because there is no way to do that.

Your problem seems to be that you think the radio ought to act like a previous generation dual band radio with completely separate hardware for each band.

Most newer dual band radios simply use hardware with a wide enough frequency range to cover both bands.

On the UV-5R, there are two displays, but they are not connected to any separate hardware. In fact, only one display is actually connected to a "radio" at any time. You can choose which display is connected to the radio, but the other display is simply telling you one other set of data that you have in working memory.

The radio radio doesn't really do "bands" at all. Yes, there is a gap in its frequency range; but that is part of its firmware programming. So far as the radio hardware is concerned, it is always on just one frequency and it doesn't care what that frequency is so long as the frequency is within its allowed range.

You have 128 memory channels, plus two VFO memories. Any of these 130 memories can be displayed in either or both the upper and/or lower display lines. And NOTHING about this radio cares whether any of those frequencies is called VHF or called UHF or called Butterscotch Pudding.

Subject: [baofeng_uv5r] Help needed to figure out how to change bands in memory mode on a UV5R5

Hi folks,

I'm new to Baofeng (and the list) and I've hit a wall with my new UV5R5: I can't change bands in a way that will show VHF on A and UHF on B in memory mode. It came with UHF on both.

Please save me a seat in radio operator purgatory. I've used my BF for bike treks, bike marathons, boat races, and soon coming up is pumpkin patrol, I'll be watching a bridge and trying to stay awake. Not much interest in distance or skip shooting, or making contacts in far away countries. Worse than you, I don't even have desk lamp, license plates, or emails with my call sign. The one local radio station did make me a neck lanyard with a card with my call sign. I wear that to events and meetings. I also don't have a huge antenna on my house, and just a small dual bander antenna on my vehicle. Fortunately, I'm a new beginner, and there is time for me to be "radio saved" before I die. Praise Marconi! There is hope!

Also, I have no plans to life test a BF, by small boys, water, sun UV rays, fire, etc.

Hi Dave:

There’s no “best way” to be a ham. I’d say, you’re a pretty good operator. I’m not a DXer or contester. That said, it is fun to know that your signal got halfway around the planet, especially if you are a QRP operator, like me. Working some exotic Expedition is a kick, especially if you do it with 5 watts on HF. It’s usually a tribute to the operator at the other end that I’ve had a couple DX qsos like that.

I’ve done my share of building, assembling kits, and even public service events. But, these days, all my ham activity is at a more leisurely pace. That’s one of the niceties of being retired. :)

There’s room in the hobby for a very wide range of amateur radio participation. Choose what moves you.

> Had a chat with a guy several months ago who was quite capable of running digital phone systems, but expressed surprise to me that using radio gave reliable communication without wire involvement. I assured him it was all possible, but kept the technical side light because I didn’t want to discourage him in any way. Need to touch base with him again soon and let him know about the UV5R. If he wants worldwide communication without wires, the combination of a license and IRLP will give him that option, and I’m sure the radio will be within his budget because fancy OCR stuff definitely was, hi hi.

>
> I've helped test and get a couple of hundred new hams into amateur radio over the past 18 to 24 months. Most do not have a solid electronics background, and many are not interested in using the radio in a hobby aspect, but instead are getting their licenses because they have become involved in some other endeavor which exposed them to the use of/for amateur radio (other volunteer work typically). Those people are interested in learning the proper use of equipment, but they are not interested in learning ham radio as a hobby. That's perfectly okay with me. That is part of what makes amateur radio so great, there is something for every body, whether it is technical or operational.
>
> Just because someone isn't interested in why or how radio waves propagate, or how to install or replace a connector or other part, doesn't make them a "bad" ham radio operator. And, just because someone has deep technical skills doesn't make them a "good" ham radio operator.

That video was interesting I've dropped mine several times now had it kicked once by my son totally by accident had only one little cosmetic plastic piece fall off on the bottom right side.
That being said my radio club went to hoodoo ski resort for the scouts we used my baofeng to make contact off the w7pra network 440 they have there I also used it when I ran security for a small local event going to use it again while working on a repeater our clubs 440 is located where our 2m is and we are working on the 2m. For being as cheap as they are this little uv5r v2+ has not let me down yet my new ht has a more consistent power output and I have a harder time running that battery down than I do the baofeng battery but I'm not disappointed by my baofeng my son is studying for his tech license and I plan to give him my baofeng figure of it handled the crap I've done to it then it should be able to handle him just fine!!

Hello,

I just received my brand new UV5R+. My Firmware: BFB297 / N5R2407. It has some S-Meter functionality and via Chirp I can skip memory-channels while scanning. Squelch didn't work out of the box. After setting the right values Squelch is now working fine. I can not change TX-Power in Memory Mode... but I think it's normal!? In VFO-Mode I can change power.

Attachments: 1 described; binary payloads are missing from this source WARC

Excellent document on the characteristics/properties of various battery types by TI. Baofengs all use LiPo/Lithium, but still it is good to know about others. Information includes charging and discharge characteristics and requirements.

This weekend is my first chance to do pumpkin patrol.
October 30 and 31.

Task is to sit in my vehicle, in sight of a bridge. Note
and report any suspicious activity. Work through net
control.

Anyone out there done pumpkin patrol? I've got some
advice from the coordinator (plan for cold weather, run
the car now and again so as not to have a dead battery).

But, there is often some first hand wisdom from those
who have done this before. What can you tell me?

.

Hello,
My name is Amy and I will be taking the ham radio test on Saturday, Halloween. I have been a member here for a long time but after moving across the country and life happening, am just now posting.

My kids are age 15 (Daughter) and 13 (Son) and will begin studying for the test soon and I am going to try to get my significant other to take the test as well. He loves to hunt...do any of you hunt/fish/camp and take your radios with you? Just trying to think of ways to convince him it's worthwhile for him to do. -Haha, I figure normally it's the husband trying to get the wife to participate so there is a different spin.

He is a retired disabled veteran (TBI) and it is difficult for him to read and concentrate for long periods of time. There are some local radio clubs and we plan on joining one. I bought flash cards for the kids and him to use but they haven't come yet. I have used several different online sites to help me study and take practice exams.

Also, I plan on buying a Baofeng UV82. But do I want the high power version?

Thank you for your time, wish me luck on Sat. :)

Amy

Welcome, and good luck. As to hunting, check the local
laws. Off the edge of my memory, in PRNY, not allowed.
Would be nice, though. Not much is allowed in PRNY.

What is TBI?

I use the Baofeng UV5R when I go hiking. Every time I would go onto a new trail, I'd call in to the other Ham guys and let them know where I was. One time it took me a lot longer than I expected getting back to the parking lot.. my cell phone was out of service area, but I was able to talk to a neighbor who is also a Ham enthusiast by hitting our local repeater, and he was able to call my wife and let her know I was running late (and not lying in a ravine with a broken leg somewhere).

Whatever Baofeng you buy will be just fine. I would go with the 8 watt if I were you and already had my heart set on it. I've had mine for almost 2 years and it goes everywhere with me, especially when I'm out in the wilderness.

The high power version is not necessary.The extra 3 watts won't make a differenceand you will just kill your battery quicker.
The higher power just feeds into the CBmythology that mo' is betta', that's whythey sell 65 and 75 watts 2 meter CBs,when a 50 watt unit works just as well.
Spend your money on antenna not power. ==

Amy,

The majority of folks here will tell you there is very little difference between a 5 watt vs. a 7-8 watt radio. Most of the difference in signal is due to a better antenna. Also be aware on Baofeng radios that have the higher power level quoted are on the VHF side, UHF is normally 5-6 watts. If you really want extra power in an HT, take a look at the TYT TH-UV8000D model radio that's 10 watts on both VHF and UHF.

As to the hunting issue, how does your husband plan to communicate with you (or anyone else) miles away from the nearest cell phone tower? Cell phone companies don't spend $2M per site to allow Bambi to chat with other deer.

You can have a high power radio and a cruddy antenna and it won't make a difference.
I highly recommend getting a aftermarket antenna the Nagoya 771 is a good one I have one of those but I also connect to a home made dualbband j pole I made that's 35 ft in the air.
I run on low power and hit over 30 miles away my clubs repeater also I've recently started experimenting with other repeaters and power output and I'm pretty amazed at the distances this uv5r gets.
Take your time don't rush to get the 8w model its a good one but spend less get a good antenna and a bigger battery.
I bought the 10 buck mag mount for my truck that has awesome range imo I've even set it up on my deep freezer before I had my jpole up outside and had wonderful results.
Before you spend the big bucks remember one thing antenna antenna antenna that will make the world of difference.

Hunting using radios.....grin...
I can well remember a situation that to me was more than funny.
1. Here where I live the use of radios to coordinate a hunt is illegal.2. At many sporting goods store marine band handhelds are available at fair prices.3. Most of these handhelds come right up on Chan 16 when they are turned on (the marine emergency channel).4. At a local lake most of which is in a State Park the park rangers monitor marine 16 for boaters in trouble.
I was sailing on the lake one day and heard a pair of guys coordinating a hunt for some elk just outside the park right on marine chan 16.   By the way it was NOT elk season.
Of course the Game Fish and Parks Rangers who easily communicate with the Game Wardens were listening too.
Upshot....
$500 fines each, loss of two rifles, two radios, hunting privileges for two years, and, oh yes, both of the two pickup trucks that were being used in the hunt and one of them was almost new.
One can't fix stupid but the state can make it pay. Dave J   AF0DJ

TBI is traumatic brain injury. What is PRNY?

He hunts Wyoming mostly, no cell phone coverage where he hunts. I am only thinking he would use it in case of emergency, to call for help btw. Lots of grizzly bears where he goes.

Thank you,
Amy

Amy,
Remember one thing which is in the FCC rules if there is a emergency he can legally broadcast without a license until the emergency is resolved though it would be nice to have a license so he can understand how to make a makeshift antenna if needed for better range hope this helps a little.

Thank you I will check out that one. I only looked at the baofeng because it is inexpensive. Later when I decide how far we all want to go on this journey I will look into a more expensive set up. Sounds like photography, put your money in the lens not the camera. :)

He doesn't communicate while out hunting while in the mountains, mostly there is no cell phone coverage but lots of bears. (Elk hunting)
If he had a ham radio I am thinking he could reach a repeater to call for help.
He doesn't go hunting alone but when you are that far out every second helps.

Also to be clear he is not my husband. My husband died while out hiking in a remote area in Alaska. The group he was with had to send a runner back 2 miles to call for help. It took a very long time for help to arrive.

So you can see why I might worry...my kids and I moved from Alaska to OK two years later to be near family.

Amy,

The majority of folks here will tell you there is very little difference between a 5 watt vs. a 7-8 watt radio. Most of the difference in signal is due to a better antenna. Also be aware on Baofeng radios that have the higher power level quoted are on the VHF side, UHF is normally 5-6 watts. If you really want extra power in an HT, take a look at the TYT TH-UV8000D model radio that's 10 watts on both VHF and UHF.

As to the hunting issue, how does your husband plan to communicate with you (or anyone else) miles away from the nearest cell phone tower? Cell phone companies don't spend $2M per site to allow Bambi to chat with other deer.

I've done em a couple of times when I lived in Pennsylvania. The best I can tell you, is make sure you have others posted at other bridges, two sets of eyes at all bridges, as a just in case. You'll need others posted at other bridges, simply because you scare em off one bridge, they'll just be an asshole and do it from another bridge. Hide your weapons (and I hate to mention it, but it's in your best interest).

There is no such rule. People distort the provision in part 97 that allows amateurs to operate out of license class band limits in an emergency. They try to convince themselves that this applies to all persons on all frequencies, licensed or not. It only applies to licensees of part 97. A similar provision exists for part 90 licensees.

If you are a licensed amateur, in a real emergency...immediate danger to YOUR life, you may use any and all amateur frequencies in or out of your license class to call for help. But only amateur radio frequencies. You cannot use frequencies of another radio service, such as police, etc.

I live in Athens, TN... with a vertical on a 20 ft mast I can hit Knoxville TN (30 miles or so) and Chattanooga (50 miles), and I I'm not very high elevation. I hiked up onto Starr Mountain in Cherokee National Forest and using the same antenna I could reach the repeater on Monteagle, about 77 miles away to the west.

The good thing about the 8W versions is that they insure the radio you are buying is not something made earlier. Those earlier batches had defects due to QC problems.

A good example would be the defective jack issue batch that was found in bfb 311- 313 series.

You will also get the better stock antenna with the 8W versions

Amy,

The majority of folks here will tell you there is very little difference between a 5 watt vs. a 7-8 watt radio. Most of the difference in signal is due to a better antenna. Also be aware on Baofeng radios that have the higher power level quoted are on the VHF side, UHF is normally 5-6 watts. If you really want extra power in an HT, take a look at the TYT TH-UV8000D model radio that's 10 watts on both VHF and UHF.

As to the hunting issue, how does your husband plan to communicate with you (or anyone else) miles away from the nearest cell phone tower? Cell phone companies don't spend $2M per site to allow Bambi to chat with other deer.

On Mon, Oct 26, 2015 at 9:32 AM, Mark Tyree marcus.tortoise@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

I use the Baofeng UV5R when I go hiking. Every time I would go onto a new trail, I'd call in to the other Ham guys and let them know where I was. One time it took me a lot longer than I expected getting back to the parking lot.. my cell phone was out of service area, but I was able to talk to a neighbor who is also a Ham enthusiast by hitting our local repeater, and he was able to call my wife and let her know I was running late (and not lying in a ravine with a broken leg somewhere).

Whatever Baofeng you buy will be just fine. I would go with the 8 watt if I were you and already had my heart set on it. I've had mine for almost 2 years and it goes everywhere with me, especially when I'm out in the wilderness.

As to the hunting issue, how does your husband plan to communicate with you (or anyone else) miles away from the nearest cell phone tower? Cell phone companies don't spend $2M per site to allow Bambi to chat with other deer.

Hi Chris:

Seems to me almost all states have some sort of regulation (and licensing) for hunting. And, operating a amateur radio HT is regulated only by the FCC, so once one has the license, you can use it any way you like, so long as you follow the rules.

73 de Ray
K2ULR

And to Amy: Good luck on the test!!

Here's a list of the 2m and 70cm repeaters within 60 miles of Jackson Hole, WY. Of course, this doesn't mean that they will be in range, but these are the closest to his planned location starting point:

[image: Inline image 1]

[image: Inline image 2]

By the way, depending on his length of time planned for the hunt and the amount of time the radio is actually on, you may want to consider getting a radio that allows the use of an extended battery (or taking a spare smaller battery). One of the knocks on the UV-82 series is that no extended batteries are available, so if you do go that route you may want to consider getting a spare standard battery.

Not that you'll need it, but good luck with your test.

FWIW, in the Technician Class question pool valid back when I got my ticket in 2007, T8B11 asked:

"When can you use a modified amateur radio transceiver to transmit on the local fire department frequency?"

The answer was C.

When that question pool was originally issued, answer C stated: "At no time".

In February 2006 the pool was re-issued with answer C stating: "In a genuine emergency you may use any means at your disposal to call for help on any frequency"

> who have done this before. What can you tell me?

Bring your cell phone (don't rely on the radio as your ONLY means of communication)

If you will be out at night bring a good flashlight

Use an earphone so the net audio isn't being heard throughout the area - you don't want to draw attention to yourself

Don't become so focused on watching the bridge that you fail to keep an eye on everything going on around you.

A lot depends on how long your shift will be, but consider....

Bring something to snack on

Bring something to drink (probably something warm like coffee, tea, hot cocoa, or soup)

And plan for what you are going to do when it is time for whatever you have been drinking to come back out. ;-)

A few states have strange regulations about using radios while hunting (apparently PETA et al think it gives that hunters too much advantage if they can talk to each other), but most states have not fallen for this nonsense -- I have no idea about Oklahoma, but it should be easy to check.

It depends on your area, but in many places you have a better chance of reaching a repeater on ham radio than of having cell phone coverage - the ability to communicate can be important if something bad happens.

As for the high power, there really isn't much difference in the performance between 5W and 8W. You might talk with some of the hams at the local radio club. The only time the high power radio would make any difference would be if you happen to be in an area just barely on the fringe of reaching the repeater -- in THAT specific case, a little extra power could make a difference -- but most of the time you will find that the small increase in power doesn't really change anything except for running down the battery quicker.

Subject: [baofeng_uv5r] Newbie in Oklahoma

Hello,
My name is Amy and I will be taking the ham radio test on Saturday, Halloween. I have been a member here for a long time but after moving across the country and life happening, am just now posting.

My kids are age 15 (Daughter) and 13 (Son) and will begin studying for the test soon and I am going to try to get my significant other to take the test as well. He loves to hunt...do any of you hunt/fish/camp and take your radios with you? Just trying to think of ways to convince him it's worthwhile for him to do. -Haha, I figure normally it's the husband trying to get the wife to participate so there is a different spin.

He is a retired disabled veteran (TBI) and it is difficult for him to read and concentrate for long periods of time. There are some local radio clubs and we plan on joining one. I bought flash cards for the kids and him to use but they haven't come yet. I have used several different online sites to help me study and take practice exams.

Also, I plan on buying a Baofeng UV82. But do I want the high power version?

Thank you for your time, wish me luck on Sat. :)

Amy

PRNY is Peoples Republic of New York.
It's a snotty way of saying it. Sigh. We in
PRNY don't like the taxes and over regulation.

Back to BF: I did go visit the bridge where
I'm assigned for pumpkin patrol. Find it,
distances, etc. Plan a location for me to park
and sit and watch. The UV-5R did manage to
reach the repeater, so I should have comms.

You don't need anything as big as a 44. I heard of one lady who escaped a bear using a .22 short. Popped her husband in the knee, thus creating the slower runner you mentioned.☐

You've had a lot of replies, with a lot of good information. Some of the replies have gone in a couple of different directions, so figured I'd go back to your original post to comment.

Congratulations on pursuing your license, and in encouraging your kids to do so also. As to your significant other, it sounds like encouraging him with valid reasons might work, and if so great. If not, so be it. Once you and both your son and daughter are licensed, using the radios might be the best way to gain his interest and involvement.

One of the arguments in favor is, being able to operate the radio, and having experience using it, before he goes hunting (or wherever) will help ensure he will be able to use it when he does. When he gets into the area where he is hunting, testing it on the possible repeaters in range to verify what does and does not work would be well worth spending a few minutes doing. Also, making sure there is actually someone on the other end should he need to make the emergency call (or other members of his own hunting party). There are repeaters where nobody is listening at times, so all of this should be taken into consideration.

I agree with all of the comments on the extra/higher power, you are mostly wasting your money as 8 watts versus 5 watts makes almost no difference in actual communications range. A better (and higher) antenna makes all the difference in the world. Holding your radio over your head while transmitting (getting the antenna higher, and using a speaker-microphone) can make a huge difference in your range versus holding it face level, as one example. With all other factors being equal, it takes four times the power to double the range. So a 20 watt radio could theoretically have double the range of a 5 watt radio, if every other aspect was the same (antenna, location, weather, - everything). In real life experience, it is very rare that I can't communicate just as good using 5 watts of power as using 50 watts of power (with an outside antenna from my home). Only when I'm trying to use repeaters 50 to 100 miles away does the additional power make a difference.

As to emergency communications, I agree with the interpretation that it applies only to amateur radio frequencies, as several others have noted.

Please post some updates in the future after you, your son and daughter, and hopefully your significant other, get licenses.

From: Xaun Loc
Topic: 53489 Message: 53530

The reason you haven't seen that rule is because it doesn't exist -- at least not quite in the way that many seem to think.

Technically, Brandon is correct or he would be once Amy has her license -- but probably not for the reasons he thinks.

Part of the difficulty in examining the "emergency" rules is that they are actually very precise and most recent hams have no knowledge about the terms used in any of the rules, especially the emergency rules (97.401, 97.403, and 97.405). Combine this with the fact that most more experienced hams are under the mistaken impression that these rules are a Get Out Of Jail Free Card that allows them to do anything on any frequency so long as they claim it is an emergency. None of which is true.

97.401 is highly specialized and applies ONLY to "a station in, or within 92.6 km (50 nautical miles) of, Alaska" and only operating "J3E and R3E on the channel at 5.1675 MHz (assigned frequency 5.1689 MHz)" -- most hams realize that this does not apply to them but we continue to see people citing the entirety of Subpart E rather than just 97.403 or 97.405

97.403 & 97.405 apply to actual emergency situations -- which means a situation where there is an IMMEDIATE need for aid to prevent loss of life, serious (life threatening) injury, of major destruction of property.

Hams like to focus on the part of these two rules that says "No provision of these rules prevents the use ... of any means at its disposal"

The think this means that all the FCC rules go out the window the minute someone says "Emergency"

What they leave out are the words "by an amateur station"

Part of the problem is that most newer hams don't even comprehend that they hold two different amateur licenses: and operator license and a station license. In the case Brandon was suggesting, once Amy has her license, her radio would be under HER station license regardless of who was using it.

The other part of "by an amateur station" that people like to forget is that "an amateur station" is a station operating in the Amateur Radio Service. That seems obvious enough, but people don't want to admit that this limits the station to the amateur bands. Once you move outside the amateur band, you are no longer "an amateur station" -- you are then an unlicensed pirate station operating illegally in whichever radio service owns the frequency you are using.

Every radio service has its own "Emergency" rules - and those rules are very different. A few services have a specific "Emergency" rule or rules -- for example GMRS has 95.143 which is different from the ham rules and from the CB emergency rule 95.418, meanwhile FRS and MURS do not have their own specific "emergency" rule -- and neither do any of the Part 90

services!!

Instead these other services are all covered by the general emergency rule in Part 2 of the FCC rules & regulations. This rule is 2.405 which says:
Operation during emergency.
The licensee of any station (except amateur, standard broadcast, FM broadcast, noncommercial educational FM broadcast, or television
broadcast) may, during a period of emergency in which normal communication facilities are disrupted as a result of hurricane, flood,
earthquake, or similar disaster, utilize such station for emergency communication service in communicating in a manner other than that
specified in the instrument of authorization: Provided:

(a) That as soon as possible after the beginning of such emergency use, notice be sent to the Commission at Washington, D.C., and to the Engineer in Charge of the district in which the station is located, stating the nature of the emergency and the use to which the station is being put, and

(b) That the emergency use of the station shall be discontinued as soon as substantially normal communication facilities are again available, and

(c) That the Commission at Washington, D.C., and the Engineer in Charge shall be notified immediately when such special use of the station is terminated: Provided further,

(d) That in no event shall any station engage in emergency transmission on frequencies other than, or with power in excess of, that specified in the instrument of authorization or as otherwise expressly provided by the Commission, or by law: And provided further,

(e) That any such emergency communication undertaken under this section shall terminate upon order of the Commission.

Actually there is NO emergency rule in Part 90. Part 90 licensees are covered by the general Emergency Operations rule in Part 2, specifically 47 CFR 2.405 which I quoted in another message.

But you are 100% right about 97.403 & 97.405 -- they would let a Tech use USB on a ham frequency allocated for CW by Extra class operators. In fact they would let an unlicensed operator use a licensed amateur radio station in an actual emergency.

BUT they do NOT cover an licensed ham tuning his HT to the local police frequency to call in a traffic accident -- not even in a real emergency. When pinned down on that exact point, the most lenient answer I have ever seen from any FCC representative is that they probably wouldn't pursue action against an operator who broke the rules in an actual emergency unless the local authorities asked them to.

Technically the license required is the STATION license, not the operator license (hopefully you know that when you pass the test, you will receive BOTH a station license AND and operator license).

In an emergency, you can use your station to transmit on any AMATEUR frequency, using any mode.

Anyone else, could use YOUR STATION to transmit on any amateur frequency using any mode.

Say, for example, that you and your significant other were out hiking in the woods and you fell down a slope, hit your head and were unconscious. IF THERE IS NO OTHER MEANS OF COMMUNICATION, he could take your radio and make an emergency call on the local ham repeater or simplex frequency.

The question gets fuzzy if he were out there alone carrying "your" radio -- a lawyer could make a good argument that it was your "station", but that would be splitting some very thin hairs.

NJ doesn't seem to have any laws about using radios while hunting. In a state that does, you MIGHT eventually win that case on a basis of federal preemption but I wouldn't want to bet on it - especially since the FCC will not support your position. So far as the FCC is concerned states cannot regulate how you use the radio, but they can regulate what else you do while using the radio.

That was written by hams -- not lawyers or anyone who has much experience reading the code of federal regulations. You will note that this MISTAKE was corrected in the next question pool.

The current version of the question correctly says:

T2C09
Are amateur station control operators ever permitted to operate outside the frequency privileges of their license class?
D. Yes, but only if necessary in situations involving the immediate safety of human life or protection of property

****

FWIW, in the Technician Class question pool valid back when I got my ticket in 2007, T8B11 asked:

"When can you use a modified amateur radio transceiver to transmit on the local fire department frequency?"

The answer was C.

When that question pool was originally issued, answer C stated: "At no time".

In February 2006 the pool was re-issued with answer C stating: "In a genuine emergency you may use any means at your disposal to call for help on any frequency"

Part 90 does indeed having an emergency rule.

§90.407 Emergency communications.
The licensee of any station authorized under this part may, during a period of emergency in which the normal communication facilities are disrupted as a result of hurricane, flood, earthquake or similar disaster, utilize such station for emergency communications in a manner other than that specified in the station authorization or in the rules and regulations governing the operation of such stations. The Commission may at any time order the discontinuance of such special use of the authorized facilities.

§90.411 Civil defense communications.
The licensee of any station authorized under this part may, on a voluntary basis, transmit communications necessary for the implementation of civil defense activities assigned such station by local civil defense authorities during an actual or simulated emergency, including drills and tests. The Commission may at any time order the discontinuance of such special use of the authorized facilities.

In the US, we have a holiday called Haloween. How that got associated with pumpkins, I can't remember.

The patrol locates adults to watch bridges over roads. Helps convince people not to throw things (like pumpkins) in the path of travelling vehicles. The patrol started after someone threw gosh knows what, and a passing truck (lorry) window was broken, the driver was seriously injured.

Might not be known outside the USA. Feel free to ask more questions, as you desire.

Pumpkin patrol should be safety observations for children going 'trick or treating', usually done by a recognized radio club, CERT team, or ARES/Races group. CERT and ARES would normally have background checks done, as they work under the local County Sheriff or 911 system

???????????

But I've got it now - my initial google search for was pumpkin control - and only bought up the growing of veges.
I see now that it looks like watching out for trick or treaters - which stems waay back to some shady beginnings. Quite interesting history surrounding the hallow eve's celebration if one is prepared to spend some time reading the history. We don't have this in NZ - tho occasionally some parents will send their kids out on their own to knock on strangers doors on the said night, but as it's not hardly known/acknowledged here not much success is noted. I mean you could get poison sweets given to kids etc etc. Abductions etc .... I guess that's what the patrols are all about :-)

I do remember many years back some kids coming to our door asking "Trick or treat" - I told them if they really wanted something nice to eat I would show them the vege patch where they could dig some weeds in exchange for some carrots. No takers. I know when I was growing up one would not have dared go around knocking on doors asking for food. You might have got a good clout around the ear.

An excerpt from Wikipedia -
> The word "trick" refers to "threat" to perform mischief on the
> homeowners or their property if no treat is given.

Again - another good reason for a good biff around the noggin when I was growing up :-)

It seems pagan beginnings in the UK (before the practice was observed in the US) were to do with the walking dead and visiting evil spirits on those who did not "pay up". History sites show heavy religious influences.

But I guess the world is a changing place - and practices, no matter how historically sinister (which it seems hallows eve was) will find their way into other countries.

Most countries don't have the part 97, 403, etc laws - in fact is it just the US, or is it Canada too. So - perhaps lots of hams, elsewhere in the world think different - and have different legislation surrounding this issue. A friendly reminder to not paint all with the same brush. Many of this lists members are outside the US and are not governed by such rules and laws but by their own country's. Some will be "weaker" and some will be much "stronger" - think Malaysia for eg.

????????????

But I've got it now - my initial google search for was pumpkin control - and only bought up the growing of veges.
I see now that it looks like watching out for trick or treaters - which stems waay back to some shady beginnings. Quite interesting history surrounding the hallow eve's celebration if one is prepared to spend some time reading the history. We don't have this in NZ - tho occasionally some parents will send their kids out on their own to knock on strangers doors on the said night, but as it's not hardly known/acknowledged here not much success is noted. I mean you could get poison sweets given to kids etc etc. Abductions etc .... I guess that's what the patrols are all about :-)

I do remember many years back some kids coming to our door asking "Trick or treat" - I told them if they really wanted something nice to eat I would show them the vege patch where they could dig some weeds in exchange for some carrots. No takers. I know when I was growing up one would not have dared go around knocking on doors asking for food. You might have got a good clout around the ear.

Again - another good reason for a good biff around the noggin when I was growing up :-)

It seems pagan beginnings in the UK (before the practice was observed in the US) were to do with the walking dead and visiting evil spirits on those who did not "pay up". History sites show heavy religious influences.

But I guess the world is a changing place - and practices, no matter how historically sinister (which it seems hallows eve was) will find their way into other countries.

with proper precautions for fire: a candle or sterno under a clay flower pot will provide enough heat in a car to make a large difference in comfort, the flower pot is mostly to conceal the flame, some benefit from heat distribution, try ahead of time to make sure enough air gets in to keep flame burning good, if a newer car crack window on side away from wind to allow slight amount of fresh air, if you get extreme cold a space blanket is remarkable, [i spent overnight in a car with one of these at -20 f [-28 c] and overheated.

a thermos of tea [better than coffee, for some reason it seems to stay warm longer and is still drinkable if it gets cold]

some method of getting rid of the excess tea later.

as a preplanned event scouting your location ahead of time is helpful. line of sight, [field glasses?], parking where traffic does not reveal you etc.

from a more innocent time

movie "meet me in st louis" [set very early 1900's, released 1945]

one of the phone calls is 'we'll leave the carriage on the front porch,
please tell the children to bring it back when they are done stealing it'

anymore, devil's night in detroit, basically vandals and arson.

hospitals will offer free x rays of treats to check for razor blades.

o tempore, o mores
****
a poem for Sanhain, attribution withheld til later, fun to guess, i
would never have come up with the correct author myself on this one,
very non typical

A Tale Of The Thirteenth Floor

The hands of the clock were reaching high
In an old midtown hotel;
I name no name, but its sordid fame
Is table talk in hell.
I name no name, but hell's own flame
Illumes the lobby garish,
A gilded snare just off Times Square
For the maidens of the parish.

The revolving door swept the grimy floor
Like a crinoline grotesque,
And a lowly bum from an ancient slum
Crept furtively past the desk.
His footsteps sift into the lift
As a knife in the sheath is slipped,
Stealthy and swift into the lift
As a vampire into a crypt.

Old Maxie, the elevator boy,
Was reading an ode by Shelley,
But he dropped the ode as it were a toad
When the gun jammed into his belly.
There came a whisper as soft as mud
In the bed of an old canal:
"Take me up to the suite of Pinball Pete,
The rat who betrayed my gal."

The lift doth rise with groans and sighs
Like a duchess for the waltz,
Then in middle shaft, like a duchess daft,
It changes its mind and halts.
The bum bites lip as the landlocked ship
Doth neither fall nor rise,
But Maxie the elevator boy
Regards him with burning eyes.
"First, to explore the thirteenth floor,"
Says Maxie, "would be wise."

Quoth the bum, "There is moss on your double cross,
I have been this way before,
I have cased the joint at every point,
And there is no thirteenth floor.
The architect he skipped direct
From twelve unto fourteen,
There is twelve below and fourteen above,
And nothing in between,
For the vermin who dwell in this hotel
Could never abide thirteen."

Said Max, "Thirteen, that floor obscene,
Is hidden from human sight;
But once a year it doth appear,
On this Walpurgis Night.
Ere you peril your soul in murderer's role,
Heed those who sinned of yore;
The path they trod led away from God,
And onto the thirteenth floor,
Where those they slew, a grisly crew,
Reproach them forevermore.

"We are higher than twelve and below fourteen,"
Said Maxie to the bum,
"And the sickening draft that taints the shaft
Is a whiff of kingdom come.
The sickening draft that taints the shaft
Blows through the devil's door!"
And he squashed the latch like a fungus patch,
And revealed the thirteenth floor.

It was cheap cigars like lurid scars
That glowed in the rancid gloom,
The murk was a-boil with fusel oil
And the reek of stale perfume.
And round and round there dragged and wound
A loathsome conga chain,
The square and the hep in slow lock step,
The slayer and the slain.
(For the souls of the victims ascend on high,
But their bodies below remain.)

The clean souls fly to their home in the sky,
But their bodies remain below
To pursue the Cain who each has slain
And harry him to and fro.
When life is extinct each corpse is linked
To its gibbering murderer,
As a chicken is bound with wire around
The neck of a killer cur.

Handcuffed to Hate come Doctor Waite
(He tastes the poison now),
And Ruth and Judd and a head of blood
With horns upon its brow.
Up sashays Nan with her feathery fan
From Floradora bright;
She never hung for Caesar Young
But she's dancing with him tonight.

Here's the bulging hip and the foam-flecked lip
Of the mad dog, Vincent Coll,
And over there that ill-met pair,
Becker and Rosenthal,
Here's Legs and Dutch and a dozen such
Of braggart bullies and brutes,
And each one bends 'neath the weight of friends
Who are wearing concrete suits.

Now the damned make way for the double-damned
Who emerge with shuffling pace
From the nightmare zone of persons unknown,
With neither name nor face.
And poor Dot King to one doth cling,
Joined in a ghastly jig,
While Elwell doth jape at a goblin shape
And tickle it with his wig.

See Rothstein pass like breath on a glass,
The original Black Sox kid;
He riffles the pack, riding piggyback
On the killer whose name he hid.
And smeared like brine on a slavering swine,
Starr Faithful, once so fair,
Drawn from the sea to her debauchee,
With the salt sand in her hair.

And still they come, and from the bum
The icy sweat doth spray;
His white lips scream as in a dream,
"For God's sake, let's away!
If ever I meet with Pinball Pete
I will not seek his gore,
Lest a treadmill grim I must trudge with him

On the hideous thirteenth floor."

"For you I rejoice," said Maxie's voice,
"And I bid you go in peace,
But I am late for a dancing date
That nevermore will cease.
So remember, friend, as your way you wend,
That it would have happened to you,
But I turned the heat on Pinball Pete;
You see - I had a daughter, too!"

The bum reached out and he tried to shout,
But the door in his face was slammed,
And silent as stone he rode down alone
From the floor of the double-damned.

Subject: Re: [baofeng_uv5r] Newbie in Oklahoma

The high power version is not necessary.

The extra 3 watts won't make a difference

and you will just kill your battery quicker.

Not a significant difference anyway. Not even one s point.

The higher power just feeds into the CB

mythology that mo' is betta', that's why

they sell 65 and 75 watts 2 meter CBs,

when a 50 watt unit works just as well.

Erm, 2 metres is NOT CB. CB (in the US) is 27Mhz (11 Metres).

Spend your money on antenna not power.

Incline to agree, a bit of antenna gain will help with reception as well as transmission.

And if you have line of sight, you don’t need all that much power. I worked packet into the Russian space station in the 90s with 25w into a ¼ wave ground plane made from nothing more than an S0239 socket and a straightened out coathanger.

With a bit of antenna gain you could probably manage the ISS on a BF (say a 5 element beam via coax)

Geoff

Aotearoa - where people outnumber guns! (US per capita - 112.6 guns/100 head count)

That may be true, but it's far easier to carry a gun than carry a cop. With an average response time (in my area) of just under 5 minutes, I'd much rather be able to defend myself than rely on the cop finishing his donut and coffee before responding to my call. The only time cops arrive here (in time to stop the bad guy) is on television or in the movies, but they do write up nice reports - after the crime has taken place.....

In the US, we have a holiday called Haloween. How that got
associated with pumpkins, I can't remember.

The patrol locates adults to watch bridges over roads. Helps
convince people not to throw things (like pumpkins) in the path
of travelling vehicles. The patrol started after someone threw
gosh knows what, and a passing truck (lorry) window was
broken, the driver was seriously injured.

Might not be known outside the USA. Feel free to ask more
questions, as you desire.

Just tell the bears that they cannot have a free extended 3800 battery, R771 antenna, free programming and demo for $30. Tell them this regardless of the lowest historical Amazon.com price for the HP version. The bears will go away quickly as they have to spend more than $30.

Mine has siren and flash mode, just hold the orange button for a couple seconds. That should make most bears die laughing, right before they make you eat the radio.

from a more innocent time

movie "meet me in st louis" [set very early 1900's, released 1945]

one of the phone calls is 'we'll leave the carriage on the front porch, please tell the children to bring it back when they are done stealing it'

anymore, devil's night in detroit, basically vandals and arson.

hospitals will offer free x rays of treats to check for razor blades.

o tempore, o mores
****
a poem for Sanhain, attribution withheld til later, fun to guess, i would never have come up with the correct author myself on this one, very non typical

A Tale Of The Thirteenth Floor

The hands of the clock were reaching high
In an old midtown hotel;
I name no name, but its sordid fame
Is table talk in hell.
I name no name, but hell's own flame
Illumes the lobby garish,
A gilded snare just off Times Square
For the maidens of the parish.

The revolving door swept the grimy floor
Like a crinoline grotesque,
And a lowly bum from an ancient slum
Crept furtively past the desk.
His footsteps sift into the lift
As a knife in the sheath is slipped,
Stealthy and swift into the lift
As a vampire into a crypt.

Old Maxie, the elevator boy,
Was reading an ode by Shelley,
But he dropped the ode as it were a toad
When the gun jammed into his belly.
There came a whisper as soft as mud

In the bed of an old canal:
"Take me up to the suite of Pinball Pete,
The rat who betrayed my gal."

The lift doth rise with groans and sighs
Like a duchess for the waltz,
Then in middle shaft, like a duchess daft,
It changes its mind and halts.
The bum bites lip as the landlocked ship
Doth neither fall nor rise,
But Maxie the elevator boy
Regards him with burning eyes.
"First, to explore the thirteenth floor,"
Says Maxie, "would be wise."

Quoth the bum, "There is moss on your double cross,
I have been this way before,
I have cased the joint at every point,
And there is no thirteenth floor.
The architect he skipped direct
From twelve unto fourteen,
There is twelve below and fourteen above,
And nothing in between,
For the vermin who dwell in this hotel
Could never abide thirteen."

Said Max, "Thirteen, that floor obscene,
Is hidden from human sight;
But once a year it doth appear,
On this Walpurgis Night.
Ere you peril your soul in murderer's role,
Heed those who sinned of yore;
The path they trod led away from God,
And onto the thirteenth floor,
Where those they slew, a grisly crew,
Reproach them forevermore.

"We are higher than twelve and below fourteen,"
Said Maxie to the bum,
"And the sickening draft that taints the shaft
Is a whiff of kingdom come.
The sickening draft that taints the shaft
Blows through the devil's door!"
And he squashed the latch like a fungus patch,
And revealed the thirteenth floor.

It was cheap cigars like lurid scars
That glowed in the rancid gloom,
The murk was a-boil with fusel oil
And the reek of stale perfume.
And round and round there dragged and wound

A loathsome conga chain,
The square and the hep in slow lock step,
The slayer and the slain.
(For the souls of the victims ascend on high,
But their bodies below remain.)

The clean souls fly to their home in the sky,
But their bodies remain below
To pursue the Cain who each has slain
And harry him to and fro.
When life is extinct each corpse is linked
To its gibbering murderer,
As a chicken is bound with wire around
The neck of a killer cur.

Handcuffed to Hate come Doctor Waite
(He tastes the poison now),
And Ruth and Judd and a head of blood
With horns upon its brow.
Up sashays Nan with her feathery fan
From Floradora bright;
She never hung for Caesar Young
But she's dancing with him tonight.

Here's the bulging hip and the foam-flecked lip
Of the mad dog, Vincent Coll,
And over there that ill-met pair,
Becker and Rosenthal,
Here's Legs and Dutch and a dozen such
Of braggart bullies and brutes,
And each one bends 'neath the weight of friends
Who are wearing concrete suits.

Now the damned make way for the double-damned
Who emerge with shuffling pace
From the nightmare zone of persons unknown,
With neither name nor face.
And poor Dot King to one doth cling,
Joined in a ghastly jig,
While Elwell doth jape at a goblin shape
And tickle it with his wig.

See Rothstein pass like breath on a glass,
The original Black Sox kid;
He riffles the pack, riding piggyback
On the killer whose name he hid.
And smeared like brine on a slavering swine,
Starr Faithful, once so fair,
Drawn from the sea to her debauchee,
With the salt sand in her hair.

And still they come, and from the bum
The icy sweat doth spray;
His white lips scream as in a dream,
"For God's sake, let's away!
If ever I meet with Pinball Pete
I will not seek his gore,
Lest a treadmill grim I must trudge with him
On the hideous thirteenth floor."

"For you I rejoice," said Maxie's voice,
"And I bid you go in peace,
But I am late for a dancing date
That nevermore will cease.
So remember, friend, as your way you wend,
That it would have happened to you,
But I turned the heat on Pinball Pete;
You see - I had a daughter, too!"

The bum reached out and he tried to shout,
But the door in his face was slammed,
And silent as stone he rode down alone
From the floor of the double-damned.

Now, that's the kind of real world wisdom I'd been thinking.
Temperatures that night should not fall below freezing, but even that is
plenty cold. The ground where I will be is fairly level. It is tempting
to get a candle in a glass jar, and make some kind of holder. Though, a
candle might put out enough light to make it hard to see the bridge. Who
knows?

I've never spent a night with a foil space blanket, but good to know
they work. I've heard that in the original packing, they tend to break
into foil ribbons. It helps to unfold the blanket, and pack it more
loose, and store it in a larger bag.

Binoculars is a good idea. I have a pair in my radio bag, from when I
was doing the boat launch radio detail. Turns out, I didn't use them.
But they were nice to have.

I did drive by the location yesterday, and found a place I can park.
Place which gives a good view of the bridge.

Thank you for good ideas.

How about washington DC where the trick or treating congressman wants a
couple million in a pork barrel bill he's sponsoring?

Nebraska, where treaters arrive by F150, because the houses are far apart.

I've heard that about Detroit, burn down all the abandon houses, and a
large number of the occupied ones all on the same night.

I'd be curious of how the NCVEC Question Pool Committee feels about your opinion of their credentials. <chuckle>

My point was that from February 2006 until the new Element 2 Question Pool was issued in in 2010, prospective Techs were being taught that in an emergency (let's not argue our interpretations of "emergency" please) it was OK for an Amateur to operate on frequencies outside those assigned the Amateur Radio Service, specific in this instance Part 90 PS frequencies assigned to a fire department. It is your OPONION that it was a "mistake" to change T8B11 from a definitive *never* answer to instead relying on an individual operator's definition of an *an emergency*. But it's a FACT the NCVEC QPC made the change, and it would be interesting to know how many Amateurs were granted licenses after getting T8B11 correct on their tests, and how many had already missed enough answers that they would have failed if they had chosen an answer other than C.

And like I said, it's your OPINION the NCVEC QPC made a mistake.

It's my opinion they made no mistake. It seems unlikely to me they would pull an existing one year old Question Pool to modify it and then reissue it in order to supply incorrect information to prospective Amateur Radio operators for the remaining four years the pool would be in effect.

It's your OPINION they corrected what you allege is a mistake. But T8B11 from the 2006 Element 2 Pool specifically asks when a Part 97 licensee can operate on Part 90 frequencies. T2C09 from the 2010 and 2014 Element 2 Pools simply offered a different question in the Subelement regarding Emergency Communications to test a familiarity with 97.403.

In my opinion, in order for the QPC to have *corrected* what you allege is a mistake, they would need to have returned 2006 Element 2 Question Pool T8B11 Answer "C" back to the original "At no time".

We both have our opinions, and in my opinion you have no authority to sway my opinion unless you choose to come out of your cloak of anonymity and provide some credentials that might influence me to change my opinion. But your simply stating that the NCVEC QPC are merely Hams that don't have the experience reading the code of federal regulations that you allude to have is just your OPINION.

Sheesh. Ready to move on? It is, in my opinion.

I'd be curious of how the NCVEC Question Pool Committee feels about your
opinion of their credentials. <chuckle>

My point was that from February 2006 until the new Element 2 Question Pool
was issued in in 2010, prospective Techs were being taught that in an
emergency (let's not argue our interpretations of "emergency" please) it was
OK for an Amateur to operate on frequencies outside those assigned the
Amateur Radio Service, specific in this instance Part 90 PS frequencies
assigned to a fire department. It is your OPONION that it was a "mistake"
to change T8B11 from a definitive *never* answer to instead relying on an
individual operator's definition of an *an emergency*. But it's a FACT the

NCVEC QPC made the change, and it would be interesting to know how many Amateurs were granted licenses after getting T8B11 correct on their tests, and how many had already missed enough answers that they would have failed if they had chosen an answer other than C.

That was written by hams -- not lawyers or anyone who has much experience reading the code of federal regulations. You will note that this MISTAKE was corrected in the next question pool.

The current version of the question correctly says:

T2C09
Are amateur station control operators ever permitted to operate outside the frequency privileges of their license class?
D. Yes, but only if necessary in situations involving the immediate safety of human life or protection of property

****
Roger KJ4AJP wrote:

FWIW, in the Technician Class question pool valid back when I got my ticket in 2007, T8B11 asked:

"When can you use a modified amateur radio transceiver to transmit on the local fire department frequency?"

The answer was C.

When that question pool was originally issued, answer C stated: "At no time".

In February 2006 the pool was re-issued with answer C stating: "In a genuine emergency you may use any means at your disposal to call for help on any frequency"

Yep... it was QUITE fun this year.

It was nice having a few Baofengs around to where the Scouts could hop on the Allstar Node when the bands shut down in Hawaii. And besides, with the lower audio pickup in the microphones, when they realized that they were talking to someone over 3000 miles away, they tended to yell into the radio.

HF really stunk this year, but we fought the weather and the Air Show and I'm surprised we had the turnout we had.

My second favorite moment was when a 16 y/o Eagle Scout said ... "WOW you can actually hear what the other person is saying! Usually my cell phone breaks up and I have to text them." ... That's when we showed them the FLDigi station. "You mean you can send TEXT MESSAGES OVER RADIO???" Yea...

My FIRST favorite moment was when we were on the UK hub, and an 8 y/o Cub Scout was talking to some guys in England, he turned to me and say .... "Why do they talk so funny?"

BUT that's what JOTA is all about. Scouts talking on amateur radio around the world, getting exposed to the hobby, and HOPEFULLY learning that there's more out there than what they see just outside their front door.

Correct me if I'm wrong....

But can't ANYONE (don't even have to be licensed) use any radio on any frequency IF (and it's a BIG IF) there is an immediate threat to Life or property?

I seem to remember something somewhere where there was a trapped hiker or something about a year ago who talked on public safety frequencies because he was trapped or something. My mind is a little foggy about the details, but I think the guy was a Ham, and somebody tried to raise a stink about it. And I guess the FCC said "No, sorry. Eminent threat of life. No violation."

OH well ... I could be wrong.

You are right James it has also been stated many times by long time hams where I am that if there's a immediate threat to loss of life or property one can transmit for emergency purposes only.
One of the VEC's where I tested was also talking about being able to reach out in that kind of situation without needing a license he did state a license is nice so it can be looked up quickly and know who their dealing with but not required for imminent danger to loss of life or property.

The story I remember reading that sticks with me was further back than a year, and for the life of me I can't re-find it. In that instance the Ham was also "Sheriff's Auxiliary" or similar and had modified his radio for their freq. He came upon a hiker with a broken leg and called out on the Sheriff's freq and got help.

Later on the Sheriff's dept., not the FCC, prosecuted him for interfering with their official duties or whatever. The guy lost his license and radios.

Could be urban legend, or just a cautionary tale...

In general, the FCC does not become involved in such cases unless the agency holding a license for the misused frequency formally complains.

There is a world of difference between those acts which the FCC (or any other enforcement agency) will actively prosecute compared with acts that are illegal under the specific wording of a law or regulation. When considering "emergency" situations you have to first consider the validity of the "emergency" (which is often a matter of opinion and often poorly reported) and then realize that any enforcement agency is normally going to apply the "Lesser of two evils principle" (the principle that when faced with selecting from two unpleasant options, the one which is least harmful should be chosen.)

The only position I hold in this conversation is that the members of the NCVEC QPC are not as inept as you imply they are, that they did not revise the Element 2 Question Pool in 2006 by mistake, and they did not correct any alleged mistake in subsequent Pools, but instead offered a differently worded question.

It's a fact that from 2006 until the next Pool in 2010 they were teaching prospective Techs that it was allowed to operate with a modified Amateur radio on Part 90 frequencies in the event of an emergency.

Regardless of what you think I said, I offered no opinion on if I personally thought that instruction was correct or not.

Give it a rest.

IMO, in a true emergency, especially concerning my family and friends, rules and regulations fly out the window and I will use whatever means at my disposal to protect them, including using a radio or a S/W .357 mag, either in trying to get help, or providing protection from man or beast.

Let the courts sort out the details when the danger is subdued.

In some countries, Australia being one, this is an accepted process. In various manuals, it’s emphasised that ‘if you are in distress, you may use any means to obtain assistance’.

Your situation must meet the accepted description of ‘distress’ ie ‘grave and imminent danger’ and ‘requiring immediate assistance’. So a flat tyre isn’t going to cut it, but being trapped in a wrecked car certainly would. As I understand it, the test is whether lives were in danger and if so, was there another, better way to get help.

IMO, in a true emergency, especially concerning my family and friends, rules and regulations fly out the window and I will use whatever means at my disposal to protect them, including using a radio or a S/W .357 mag, either in trying to get help, or providing protection from man or beast.

Let the courts sort out the details when the danger is subdued.

Hi Amy

Best of luck to your family in passing the technician test and getting licensed.

As to your question:

"Also, I plan on buying a Baofeng UV82. But do I want the high power version?"

I answer you by saying it's better to have it and not need it, vs. need it and not have it. Soon you will learn that the FCC requires you to use the LEAST amount of power to carry the conversation. But who is to say what constitutes the "least" amount? Will 1/2 watt do it, perhaps, will 25 watt do it, perhaps!

So the UV-82 is a nice radio, and I am thinking that you will need 4 radios for your family. That can be a bit expensive, so if you are concerned you may want to look into the BF-F8 HP radio.

Hope that helps, and again best of luck on passing the test.

Hi Chris and All

"PRNY.... What is TBI?"

You ask for an acronym explanation but yet you yourself use one without explaining it?!

What is PRNY?

How annoying is that?

Please folks, at least give us a fighting chance and explain your acronyms at least one time in your post(s).

I suggest that TFTYUAA (The First Time You Use An Acronym) you explain it and then you can use it freely in your post. The use of Acronyms, it does not show how smart you are, but how uncaring you can be. After all the spirit of these fora is to help one another and you can not help if you don't care. Explaining acronyms shows that you know your stuff and that makes you a trustworthy Elmer. Now think about that?!

Thank you

Wassim,
He did explain a bunch of posts back what it stood for. PRNY=Peoples Republic of New York. And being from neighboring NJ, I understand his statement. ;)

PRNY is Peoples Republic of New York.
It's a snotty way of saying it. Sigh. We in
PRNY don't like the taxes and over regulation.

Back to BF: I did go visit the bridge where
I'm assigned for pumpkin patrol. Find it,
distances, etc. Plan a location for me to park
and sit and watch. The UV-5R did manage to
reach the repeater, so I should have comms.

This is long and, of course, off topic - read it or not (your choice)

Wassim had a point, and so does Kevin, but the problem isn't acronyms or people trying to show how smart they are... the problem is language, dialect, jargon, argot, and slang.

People write pretty much the same way they talk -- which typically works in their immediate environment among their friends and associates, but which quickly breaks down in a more diverse audience.

This is nominally a group of radio users, most of whom are licensed amateur radio operators, typically we expect that other radio users will recognize common technical words, abbreviations, acronyms, and jargon.

No one thinks twice about using the abbreviation MHz for Megahertz or explaining that a Megahertz is one million Hertz and that a Hertz represents one cycle per second of a waveform. How often does someone need to explain that PL is a trademark acronym for the trademark PrivateLine which is a trade name for CTCSS which is an acronym for Continuous Tone Coded Squelch System. Considering the demonstrated lack of basic knowledge among SOME of the group members, one could argue that EVERY technical term and acronym needs to be explained, especially considering that these people are a major part of the reason this group exists - but if we did that it would easily double the bandwidth being consumed here while adding nothing to the conversations. So, unless the question itself indicates a lack of understanding, we generally assume that people should either understand common terms or be willing to look them up (a pretty reasonable assumption since we are all online and anyone can easily Google any term they don't understand).

Often it isn't necessary to know exactly what a term means, because the context provides adequate information. (We'll come back to this in a minute.)

Now, let's take a moment to look at the two acronyms that triggered Wassim's displeasure: TBI and PRNY

These are both acronyms and neither is commonly used radio jargon, but there is one critical difference.

TBI is a standardized acronym that is fairly common is American English today. The term has not (yet) been accepted as part of general American English by any of the standard dictionaries, but it already appears in the "Medical" category of the Merriam-Webster dictionary and if things continue as they have over the past decade it will probably enter the main dictionary in a few years. Even treating it as medical jargon, it is a standardized term that is easy to look up.

PRNY on the other hand, is an acronym for an invented term with no standard meaning - the full form is People's Republic of New York which itself is a non-standard term. There is, of course, no such entity. There full term is readily recognized among conservative groups as an insult to what are perceived as ultra-liberal policies common to the state of New

York. The "People's Republic" epithet is frequently applied to New York, New Jersey, and California (although rarely, if ever, abbreviated when used for California) and occasionally to other places such as Massachusetts or Connecticut.

Quite a few people here recognized both terms (including myself), but the key difference is that you can look up TBI online (or in any large recent dictionary if anyone has access to a printed dictionary today) and you will consistently find a clear definition, whereas you cannot look up PRNY to find it means "People's Republic of New York."

Now, back to context. Context is generally the way people learn about unfamiliar words and terms. Often context is sufficient to provide all the information which is needed. For example, when Amy used the term TBI, the context would have been clear to most people as some sort of medical condition that resulted in the difficulties she mentioned. Unless someone was deeply interested, the exact meaning of "TBI" itself was unimportant. If I said something like "I suffer from AMD which makes reading small text on the computer difficult," it really wouldn't be all that helpful to spell out "Age-related Macular Degeneration" (which, by the way, I don't have; it was just an example).

The simple rule "Spell out all acronyms the first time you use them" sounds reasonable - but like most simple rules, it simply doesn't work that well in the real world. What constitutes the "first time" - does that mean the first time I ever use the acronym, or the first time I use the term in this group, or in a specific thread, or in each email?

Are acronyms the only terms that need to be explained? If I just say "tone" instead of "PL" or "CTCSS" does that absolve me from needing to explain what I'm talking about? (At least half the new users in this group typically don't understand "tone" even when they think they do).

To what extent is amateur radio (or simply two-way radio) jargon adequate without explanation? I already mentioned tone, but how about terms like "repeater" (which doesn't repeat anything) or "simplex repeater" (which does repeat things, but is not necessarily simplex and is not legally a repeater under the FCC rules in the US).

In any occupation or hobby there are unique terms that are not understood by outsiders or new-comers. SOME of those terms are acronyms but many are not. Many acronyms are used in ways that are not a direct one-for-one replacement for the full term. And in many cases the acronym is so much more common than the full term that people in the field would be more confused if they saw it spelled out. Anyone who has been in the Army (or an Army family) easily recognizes the term AWOL, but most would have to stop a minute if they were reading something and ran across the phrase Absent Without Official Leave -- meanwhile on the Navy side, the equivalent term is UA for Unauthorized Absence. A soldier might "get an Article 15 for going AWOL" while a sailor would "stand Captain's Mast for UA" in either of those cases, would simply spelling out the acronym really help anyone understand what was said.

Meanwhile, as our non-US friends keep trying to remind us, this is an international group. While the discussions are conducted in English, we have users for whom English is not their primary language. Even among native English speakers, there are vast differences. If I advised you not to store extra petrol in the boot many here wouldn't have the foggiest idea what I was talking about, but many would see that as perfectly normal advice.

Acronyms, technical terms, jargon, slang, and regional usage all are a part of communicating - and we all have to work together to make that communication happen smoothly. Sometimes that means explaining uncommon terms - or even common terms that the

reader appears to not know. Sometimes that means looking up a term you didn't understand and sometimes it means simply ignoring a word you didn't recognize if it really isn't important to what you were reading.

Before the Internet (yes there was a world before the Internet), there was an earlier worldwide system of networked computers where people communicated much as we do here. That network got by on two basic rules which no one seems to have improved upon in the decades since then:

1) Thou shalt not excessively annoy others.

and

2) Thou shalt not be too easily annoyed.

Most people seem to recognize the value of rule #1 (even if they don't follow it 100%), but there seems to be a problem getting people to recognize the equal importance of rule #2.

That last post was error. CTCSS is not an acronym as it is not a word or
phrase:

See
Acronym - Wikipedia, the free encyclopedia
<https://en.wikipedia.org/wiki/Acronym>
https://en.wikipedia.org/wiki/*Acronym*
Wikipedia
An *acronym* is an abbreviation, used as a word, which is formed from the
initial components in a phrase or a word. Usually these components are
individual letters (as in NATO or laser) or parts of words or names (as in
Benelux).

From: Jardy Dawson
Topic: 53598 Message: 53608

Another confusing situation is where people, even experienced hams, misuse common things like asking 'are you at your QTH?'. They want to know if you at at home, where QTH actually means 'what is your location'. So a person is always at there QTH. Some things were only meant to be shortcuts for Morse Code or HF (High Frequency) use, not on uhf/vhf. If you are doing emergency communications, please use plain English.

This is long and, of course, off topic - read it or not (your choice)

Wassim had a point, and so does Kevin, but the problem isn't acronyms or people trying to show how smart they are... the problem is language, dialect, jargon, argot, and slang.

People write pretty much the same way they talk -- which typically works in their immediate environment among their friends and associates, but which quickly breaks down in a more diverse audience.

This is nominally a group of radio users, most of whom are licensed amateur radio operators, typically we expect that other radio users will recognize common technical words, abbreviations, acronyms, and jargon.

No one thinks twice about using the abbreviation MHz for Megahertz or explaining that a Megahertz is one million Hertz and that a Hertz represents one cycle per second of a waveform. How often does someone need to explain that PL is a trademark acronym for the trademark PrivateLine which is a trade name for CTCSS which is an acronym for Continuous Tone Coded Squelch System. Considering the demonstrated lack of basic knowledge among SOME of the group members, one could argue that EVERY technical term and acronym needs to be explained, especially considering that these people are a major part of the reason this group exists - but if we did that it would easily double the bandwidth being consumed here while adding nothing to the conversations. So, unless the question itself indicates a lack of understanding, we generally assume that people should either understand common terms or be willing to look them up (a pretty reasonable assumption since we are all online and anyone can easily Google any term they don't understand).

Often it isn't necessary to know exactly what a term means, because the context provides adequate information. (We'll come back to this in a minute.)

Now, let's take a moment to look at the two acronyms that triggered Wassim's displeasure: TBI and PRNY

These are both acronyms and neither is commonly used radio jargon, but there is one critical difference.

TBI is a standardized acronym that is fairly common is American English today. The term has not (yet) been accepted as part of general American English by any of the standard dictionaries, but it already appears in the "Medical" category of the Merriam-Webster dictionary and if things continue as they have over the past decade it will probably enter the main dictionary in a few years. Even treating it as medical jargon, it is a standardized term that is easy to look up.

PRNY on the other hand, is an acronym for an invented term with no standard meaning - the full form is People's Republic of New York which itself is a non-standard term. There is, of course, no such entity. There full term is readily recognized among conservative groups as an insult to what are perceived as ultra-liberal policies common to the state of New York. The "People's Republic" epithet is frequently applied to New York, New Jersey, and California (although rarely, if ever, abbreviated when used for California) and occasionally to other places such as Massachusetts or Connecticut.

Quite a few people here recognized both terms (including myself), but the key difference is that you can look up TBI online (or in any large recent dictionary if anyone has access to a printed dictionary today) and you will consistently find a clear definition, whereas you cannot look up PRNY to find it means "People's Republic of New York."

Now, back to context. Context is generally the way people learn about unfamiliar words and terms. Often context is sufficient to provide all the information which is needed. For example, when Amy used the term TBI, the context would have been clear to most people as some sort of medical condition that resulted in the difficulties she mentioned. Unless someone was deeply interested, the exact meaning of "TBI" itself was unimportant. If I said something like "I suffer from AMD which makes reading small text on the computer difficult," it really wouldn't be all that helpful to spell out "Age-related Macular Degeneration" (which, by the way, I don't have; it was just an example).

The simple rule "Spell out all acronyms the first time you use them" sounds reasonable - but like most simple rules, it simply doesn't work that well in the real world. What constitutes the "first time" - does that mean the first time I ever use the acronym, or the first time I use the term in this group, or in a specific thread, or in each email?

Are acronyms the only terms that need to be explained? If I just say "tone" instead of "PL" or "CTCSS" does that absolve me from needing to explain what I'm talking about? (At least half the new users in this group typically don't understand "tone" even when they think they do).

To what extent is amateur radio (or simply two-way radio) jargon adequate without explanation? I already mentioned tone, but how about terms like "repeater" (which doesn't repeat anything) or "simplex repeater" (which does repeat things, but is not necessarily simplex and is not legally a repeater under the FCC rules in the US).

In any occupation or hobby there are unique terms that are not understood by outsiders or new-comers. SOME of those terms are acronyms but many are not. Many acronyms are used in ways that are not a direct one-for-one replacement for the full term. And in many cases the acronym is so much more common than the full term that people in the field would be more confused if they saw it spelled out. Anyone who has been in the Army (or an Army family) easily recognizes the term AWOL, but most would have to stop a minute if they were reading

something and ran across the phrase Absent Without Official Leave -- meanwhile on the Navy side, the equivalent term is UA for Unauthorized Absence. A soldier might "get an Article 15 for going AWOL" while a sailor would "stand Captain's Mast for UA" in either of those cases, would simply spelling out the acronym really help anyone understand what was said.

Meanwhile, as our non-US friends keep trying to remind us, this is an international group. While the discussions are conducted in English, we have users for whom English is not their primary language. Even among native English speakers, there are vast differences. If I advised you not to store extra petrol in the boot many here wouldn't have the foggiest idea what I was talking about, but many would see that as perfectly normal advice.

Acronyms, technical terms, jargon, slang, and regional usage all are a part of communicating - and we all have to work together to make that communication happen smoothly. Sometimes that means explaining uncommon terms - or even common terms that the reader appears to not know. Sometimes that means looking up a term you didn't understand and sometimes it means simply ignoring a word you didn't recognize if it really isn't important to what you were reading.

Before the Internet (yes there was a world before the Internet), there was an earlier worldwide system of networked computers where people communicated much as we do here. That network got by on two basic rules which no one seems to have improved upon in the decades since then:

1) Thou shalt not excessively annoy others.

and

2) Thou shalt not be too easily annoyed.

Most people seem to recognize the value of rule #1 (even if they don't follow it 100%), but there seems to be a problem getting people to recognize the equal importance of rule #2.

Another OLTOD (Off List Topic of Discussion)? BTW (By the Way) Wassim, many folks new to radio haven't a clue what an "Elmer" is. Come to think of it, some folks on this forum that claim years of radio experience don't know either, but TADFAD (That's a Discussion for Another Day). Your point is valid, however, as many times we all use acronyms in our work (or in groups of people we know) and the meaning is well known and understood, but when folks new to the conversation hear them (or read them) the meaning is sometimes lost. Even something that started out with a common meaning can change over time and use into something different, QSL? (Yes, I purposely used a Q-Code to make that last point and didn't explain it so some might have to google it to understand the joke).

Tim wasn't disagreeing with the meaning. He was pointing out that CTCSS is an abbreviation, not an acronym -- I had included it right after PL which _is_ an acronym without making the distinction that both are different categories of jargon which both would be spelled out differently but which both refer to the same thing.

Thank, Tim. I didn't know that.

Thanks, Jardy, for agreeing with Tim. It's a good day when I learn some thing new.

From: hunterspec@...
Topic: 53614 Message: 53614

I attempted to download the KK7DS Python runtime http://www.d-rats.com/download/OSX_Runtime/KK7DS_Python_Runtime_R10.pkg on my Mac an error popped up stating it needs to be an Apple product or from a trusted site. I understand I need the KK7DS Python runtime http://www.d-rats.com/download/OSX_Runtime/KK7DS_Python_Runtime_R10.pkg before I can install the CHIRP program. Any suggestions or help that could be provided would be wonderful. Thank you so much

Topic: 53614 Message: 53616

I downloaded it by changing my security settings on my Mac so the
firewall would allow the download. Then loaded Chirp. I had to go get
a driver online because the driver CD was bad, and when I installed it
my machine would not reboot. Showed the Apple logo screen and wouldn't
go any further. I ended up downloading the operating system from Apple
to fix it. Look into the safe boot and diagnostic boot before loading
jut in case. I'm not trying it again for now.

military background here, so very used to these, [this is one of the things that tripped up dan blather with his faked papers]

however, if someone uses a specialized one i am willing to look it up

many police agencies are removing the use of '10' and '11' codes in favor of clear english

10 code is possibly more in use on the CB bands than public service, although in a reduced "vocabulary'

"NATO" or "North Atlantic Treaty Organization"
https://en.wikipedia.org/wiki/NATO

"laser" or "light amplification by stimulated emission of radiation"
https://en.wikipedia.org/wiki/Laser

"CTCSS" or "Continuous Tone-Coded Squelch System"
https://en.wikipedia.org/wiki/Continuous_Tone-Coded_Squelch_System

Sure seems to qualify as an acronym to me. What am I missing?

Apparently the image that you are trying to upload to your red Baofeng did not originally come from your red Baofeng.

There are 2 possibilities for why the foreign image won't upload:

1. The firmware version of the radio that the source image was downloaded from does not exactly match the firmware version of the radio it is being uploaded to. If they don't exactly match, then CHIRP aborts the upload.

2. The radio being uploaded to has the byte that CHIRP looks at to determine if the radio is a VHF/UHF model or VHF/220 model was set to the wrong value at the factory. If the supported bands of the image and radio don't match, the upload is aborted.

If it is #1, you will have to import the channels from the master image to a tab that was created by downloading from your red Baofeng.

If it is #2, you should be able to reset the byte to the correct value using the OEM VIP software.

Another confusing situation is where people, even experienced hams, misuse common things like asking 'are you at your QTH?'. They want to know if you at at home, where QTH actually means 'what is your location'. So a person is always at there QTH. Some things were only meant to be shortcuts for Morse Code or HF (High Frequency) use, not on uhf/vhf. If you are doing emergency communications, please use plain English.

Message relayed through SETI (Search for Extra-Terrestrial Intelligence, although no terrestrial intelligence has been found yet, either)

On Oct 29, 2015, at 09:54, 'Xaun Loc' xaunloc@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

This is long and, of course, off topic - read it or not (your choice) Wassim had a point, and so does Kevin, but the problem isn't acronyms or people trying to show how smart they are... the problem is language, dialect, jargon, argot, and slang. People write pretty much the same way they talk -- which typically works in their immediate environment among their friends and associates, but which quickly breaks down in a more diverse audience. This is nominally a group of radio users, most of whom are licensed amateur radio operators, typically we expect that other radio users will recognize common technical words, abbreviations, acronyms, and jargon. No one thinks twice about using the abbreviation MHz for Megahertz or explaining that a Megahertz is one million Hertz and that a Hertz represents one cycle per second of a waveform. How often does someone need to explain that PL is a trademark acronym for the trademark PrivateLine which is a trade name for CTCSS which is an acronym for Continuous Tone Coded Squelch System. Considering the demonstrated lack of basic knowledge among SOME of the group members, one could argue that EVERY technical term and acronym needs to be explained, especially considering that these people are a major part of the reason this group exists - but if we did that it would easily double the bandwidth being consumed here while adding nothing to the conversations. So, unless the question itself indicates a lack of understanding, we generally assume that people should either understand common terms or be willing to look them up (a pretty reasonable assumption since we are all online and anyone can easily Google any term they don't understand). Often it isn't necessary to know exactly what a term means, because the

context provides adequate information. (We'll come back to this in a minute.) Now, let's take a moment to look at the two acronyms that triggered Wassim's displeasure: TBI and PRNY These are both acronyms and neither is commonly used radio jargon, but there is one critical difference. TBI is a standardized acronym that is fairly common is American English today. The term has not (yet) been accepted as part of general American English by any of the standard dictionaries, but it already appears in the "Medical" category of the Merriam-Webster dictionary and if things continue as they have over the past decade it will probably enter the main dictionary in a few years. Even treating it as medical jargon, it is a standardized term that is easy to look up. PRNY on the other hand, is an acronym for an invented term with no standard meaning - the full form is People's Republic of New York which itself is a non-standard term. There is, of course, no such entity. There full term is readily recognized among conservative groups as an insult to what are perceived as ultra-liberal policies common to the state of New York. The "People's Republic" epithet is frequently applied to New York, New Jersey, and California (although rarely, if ever, abbreviated when used for California) and occasionally to other places such as Massachusetts or Connecticut. Quite a few people here recognized both terms (including myself), but the key difference is that you can look up TBI online (or in any large recent dictionary if anyone has access to a printed dictionary today) and you will consistently find a clear definition, whereas you cannot look up PRNY to find it means "People's Republic of New York." Now, back to context. Context is generally the way people learn about unfamiliar words and terms. Often context is sufficient to provide all the information which is needed. For example, when Amy used the term TBI, the context would have been clear to most people as some sort of medical condition that resulted in the difficulties she mentioned. Unless someone was deeply interested, the exact meaning of "TBI" itself was unimportant. If I said something like "I suffer from AMD which makes reading small text on the computer difficult," it really wouldn't be all that helpful to spell out "Age-related Macular Degeneration" (which, by the way, I don't have; it was just an example). The simple rule "Spell out all acronyms the first time you use them" sounds reasonable - but like most simple rules, it simply doesn't work that well in the real world. What constitutes the "first time" - does that mean the first time I ever use the acronym, or the first time I use the term in this group, or in a specific thread, or in each email? Are acronyms the only terms that need to be explained? If I just say "tone" instead of "PL" or "CTCSS" does that absolve me from needing to explain what I'm talking about? (At least half the new users in this group typically don't understand "tone" even when they think they do). To what extent is amateur radio (or simply two-way radio) jargon adequate without explanation? I already mentioned tone, but how about terms like "repeater" (which doesn't repeat anything) or "simplex repeater" (which does repeat things, but is not necessarily simplex and is not legally a repeater under the FCC rules in the US). In any occupation or hobby there are unique terms that are not understood by outsiders or new-comers. SOME of those terms are acronyms but many are not. Many acronyms are used in ways that are not a direct one-for-one replacement for the full term. And in many cases the acronym is so much more common than the full term that people in the field would be more confused if they saw it spelled out. Anyone who has been in the Army (or an Army family) easily recognizes the term AWOL, but most would have to stop a minute if they were reading something and ran across the phrase Absent Without Official Leave -- meanwhile on the Navy side, the equivalent term is UA for Unauthorized Absence. A soldier might "get an Article 15 for going AWOL" while a sailor would "stand Captain's Mast for UA" in either of those cases, would simply spelling out the acronym really help anyone understand what was said. Meanwhile, as our non-US friends keep trying to remind us, this is an international group. While the discussions are conducted in English, we have users for whom English is not their primary language. Even among native English speakers, there are vast differences.

If I advised you not to store extra petrol in the boot many here wouldn't have the foggiest idea what I was talking about, but many would see that as perfectly normal advice. Acronyms, technical terms, jargon, slang, and regional usage all are a part of communicating - and we all have to work together to make that communication happen smoothly. Sometimes that means explaining uncommon terms - or even common terms that the reader appears to not know. Sometimes that means looking up a term you didn't understand and sometimes it means simply ignoring a word you didn't recognize if it really isn't important to what you were reading. Before the Internet (yes there was a world before the Internet), there was an earlier worldwide system of networked computers where people communicated much as we do here. That network got by on two basic rules which no one seems to have improved upon in the decades since then: 1) Thou shalt not excessively annoy others. and 2) Thou shalt not be too easily annoyed. Most people seem to recognize the value of rule #1 (even if they don't follow it 100%), but there seems to be a problem getting people to recognize the equal importance of rule #2.

This is nominally a group of radio users, most of whom are licensed amateur radio operators, typically we expect that other radio users will recognize common technical words, abbreviations, acronyms, and jargon.

No one thinks twice about using the abbreviation MHz for Megahertz or explaining that a Megahertz is one million Hertz and that a Hertz represents one cycle per second of a waveform. How often does someone need to explain that PL is a trademark acronym for the trademark PrivateLine which is a trade name for CTCSS which is an acronym for Continuous Tone Coded Squelch System. Considering the demonstrated lack of basic knowledge among SOME of the group members, one could argue that EVERY technical term and acronym needs to be explained, especially considering that these people are a major part of the reason this group exists - but if we did that it would easily double the bandwidth being consumed here while adding nothing to the conversations. So, unless the question itself indicates a lack of understanding, we generally assume that people should either understand common terms or be willing to look them up (a pretty reasonable assumption since we are all online and anyone can easily Google any term they don't understand).

Often it isn't necessary to know exactly what a term means, because the context provides adequate information. (We'll come back to this in a minute.)

Now, let's take a moment to look at the two acronyms that triggered Wassim's displeasure: TBI and PRNY

These are both acronyms and neither is commonly used radio jargon, but there is one critical difference.

TBI is a standardized acronym that is fairly common is American English today. The term has not (yet) been accepted as part of general American English by any of the standard dictionaries, but it already appears in the "Medical" category of the Merriam-Webster dictionary and if things continue as they have over the past decade it will probably enter the main dictionary in a few years. Even treating it as medical jargon, it is a standardized term that is easy to look up.

PRNY on the other hand, is an acronym for an invented term with no standard meaning - the full form is People's Republic of New York which itself is a non-standard term. There is, of course, no such entity. There full term is readily recognized among conservative groups as an insult to what are perceived as ultra-liberal policies common to the state of New York. The "People's Republic" epithet is frequently applied to New York, New Jersey, and California (although rarely, if ever, abbreviated when used for California) and occasionally to other places such as Massachusetts or Connecticut.

Quite a few people here recognized both terms (including myself), but the key difference is that you can look up TBI online (or in any large recent dictionary if anyone has access to a printed dictionary today) and you will consistently find a clear definition, whereas you cannot look up PRNY to find it means "People's Republic of New York."

Now, back to context. Context is generally the way people learn about unfamiliar words and terms. Often context is sufficient to provide all the information which is needed. For example, when Amy used the term TBI, the context would have been clear to most people as some sort of medical condition that resulted in the difficulties she mentioned. Unless someone was deeply interested, the exact meaning of "TBI" itself was unimportant. If I said something like "I suffer from AMD which makes reading small text on the computer difficult," it really wouldn't be all that helpful to spell out "Age-related Macular Degeneration" (which, by the way, I don't have; it was just an example).

The simple rule "Spell out all acronyms the first time you use them" sounds reasonable - but like most simple rules, it simply doesn't work that well in the real world. What constitutes the "first time" - does that mean the first time I ever use the acronym, or the first time I use the term in this group, or in a specific thread, or in each email?

Are acronyms the only terms that need to be explained? If I just say "tone" instead of "PL" or "CTCSS" does that absolve me from needing to explain what I'm talking about? (At least half the new users in this group typically don't understand "tone" even when they think they do).

To what extent is amateur radio (or simply two-way radio) jargon adequate without explanation? I already mentioned tone, but how about terms like "repeater" (which doesn't repeat anything) or "simplex repeater" (which does repeat things, but is not necessarily simplex and is not legally a repeater under the FCC rules in the US).

In any occupation or hobby there are unique terms that are not understood by outsiders or new-comers. SOME of those terms are acronyms but many are not. Many acronyms are used in ways that are not a direct one-for-one replacement for the full term. And in many cases the acronym is so much more common than the full term that people in the field would be more confused if they saw it spelled out. Anyone who has been in the Army (or an Army family) easily recognizes the term AWOL, but most would have to stop a minute if they were reading something and ran across the phrase Absent Without Official Leave -- meanwhile on the Navy side, the equivalent term is UA for Unauthorized Absence. A soldier might "get an Article 15 for going AWOL" while a sailor would "stand Captain's Mast for UA" in either of those cases, would simply spelling out the acronym really help anyone understand what was said.

Meanwhile, as our non-US friends keep trying to remind us, this is an international group. While the discussions are conducted in English, we have users for whom English is not their primary language. Even among native English speakers, there are vast differences. If I advised you not to store extra petrol in the boot many here wouldn't have the foggiest idea what I was talking about, but many would see that as perfectly normal advice.

Acronyms, technical terms, jargon, slang, and regional usage all are a part of communicating - and we all have to work together to make that communication happen smoothly. Sometimes that means explaining uncommon terms - or even common terms that the reader appears to not know. Sometimes that means looking up a term you didn't understand and sometimes it means simply ignoring a word you didn't recognize if it really isn't important to what you were reading.

Before the Internet (yes there was a world before the Internet), there was an earlier worldwide system of networked computers where people communicated much as we do here. That network got by on two basic rules which no one seems to have improved upon in the decades since then:

1) Thou shalt not excessively annoy others.

and

2) Thou shalt not be too easily annoyed.

Most people seem to recognize the value of rule #1 (even if they don't follow it 100%), but there seems to be a problem getting people to recognize the equal importance of rule #2.

Apparently the image that you are trying to upload to your red Baofeng
did not originally come from your red Baofeng.

There are 2 possibilities for why the foreign image won't upload:

1. The firmware version of the radio that the source image was
downloaded from does not exactly match the firmware version of the
radio it is being uploaded to. If they don't exactly match, then CHIRP
aborts the upload.

2. The radio being uploaded to has the byte that CHIRP looks at to
determine if the radio is a VHF/UHF model or VHF/220 model was set to
the wrong value at the factory. If the supported bands of the image
and radio don't match, the upload is aborted.

If it is #1, you will have to import the channels from the master
image to a tab that was created by downloading from your red Baofeng.

If it is #2, you should be able to reset the byte to the correct value
using the OEM VIP software.

The solution to that problem is simple read from new radio it will open a new window copy from other list and paste into new radio window.
When I bought my new radio a Wouxun kg-uv6x for joining SAR I read from my baofeng then read from the Wouxun copied from baofeng pasted into Wouxun window and it worked perfectly.
I do the same for friends here that buy baofengs and want my frequency list programmed into theirs I know all the firmware is mostly different so I'll just copy from my list after I do a read from their radio then paste an write and their done.

Hope that helps anyone new to these radios and anyone trying to cross program them also.

Allan,

Pressing the [3] key while powering on the radio has not been a valid method for determining the firmware version of a UV-5R radio (and it many variants) for nearly 3 years. Back in November 2012, with the introduction of BFB299 firmware (16-NOV-2012), Baofeng began hiding the "real" firmware version of these radios. All UV-5R radios since then report BFB297 in this power-on message no matter what the "real" firmware version is. So unless your red Baofeng has celebrated its 3rd birthday (or will in the next couple of weeks), it is a safe bet that it does not have BFB297 firmware.

The "real" firmware version can only be determined using CHIRP. Download from the radio and then access the Settings -> Other Settings menu. If "Firmware Message 1:" is not " VER " (radios manufactured on or after 16-NOV-2012), then "Firmware Message 1:" is the "real" firmware version. If "Firmware Message 1:" is " VER " (radios manufactured prior to 16-NOV-2012), then "Firmware Message 2:" is the "real" firmware version.

"Firmware Message 1" + "Firmware Message 2:" of the source image must exactly match the firmware version of the destination radio or CHIRP abort the upload. When the upload is aborted because of a firmware mismatch, CHIRP will show you both firmware versions so you can see why they don't match.

If it is the VHF/220 issue that I mentioned, you would be successful at keying in 220-260 MHz frequencies when you shouldn't and not successful at keying in 400-520 MHz frequencies when you should (CHIRP will report an out-of-range error).

If you would email the image that you are trying to upload and a fresh image saved from you red Baofeng, I can take a look at them to see which issue it is. Email them to: uv5r [at] kc9hi [dot] net

Brandon,

You should try importing your "master" image to the tab of your new radios. Importing is more thorough and will transfer settings that "copy-and-paste" between tabs or "importing a CSV" file will miss.

1 download from the radio to be programmed (or load an image that was previously saved from that radio) to create a "tab" that is compatible with the target radio
2 click "File" then click "Import"
3 click the button that shows "CHIRP Files (*.chirp)" and choose "CHIRP Radio Images (*.img)" from the list
4 locate the "master" image and click the [Open] button
5 make any changes at the "Import From File" menu and click the [Ok] button

Thank you for the advice. I am set up to take the test tomorrow at 10am. That is a test answer (least amount of power) so I better know that one now. :)

I'm going to start with one radio and see how it goes, LOL. I will probably wait till my first club meeting anyway before I purchase anything.

TGIF, (Thank God it's Friday)

<wn6wjn@...?subject=Re%3A%20Newbie%20in%20Oklahoma>
Hi Amy

Best of luck to your family in passing the technician test and getting licensed.

As to your question:

"Also, I plan on buying a Baofeng UV82. But do I want the high power version?"

I answer you by saying it's better to have it and not need it, vs. need it and not have it. Soon you will learn that the FCC requires you to use the LEAST amount of power to carry the conversation. But who is to say what constitutes the "least" amount? Will 1/2 watt do it, perhaps, will 25 watt do it, perhaps!

So the UV-82 is a nice radio, and I am thinking that you will need 4 radios for your family. That can be a bit expensive, so if you are concerned you may want to look into the BF-F8 HP radio.

Hope that helps, and again best of luck on passing the test.

53655. Pumpkin Patrol (Night one of two, October 30)

Yahoo group: baofeng_uv5r (2015)
Date: 2015-10-31 12:25:22 UTC
From: Christopher Young
Topic: 53655 Message: 53655

Friday Oct 30 as interesting day for me. I'd signed up
for Pumpkin Patrol (watching bridge over the highway).

The folks who designed my vehicle (1998 Chevy Blazer)
decided they knew better than I, when to turn the
lights on. If it's night and I start the motor, all
the exernal lights come on. So, I spent most of the
patrol time with the motor off. Some thing I remember
about set the parking brake and the lights won't come
on. Will try that tonight.

It did get a bit cold, down into the thirties (F).
I considered candle to help provide some heat, but
it was moonlight total darkness out there, and didn't
want to kill my night vision. So, I endured the cold.

Also, the map light is a bit much light for taking notes.
I can see what I'm writing, but can't see any thing outside
the vehicle. Not a huge problem, my eyes readjust later.
Would be nice to have some soft red light.

There were only two incidents. The travelling goodies
vehicle stopped by and brought my luke warm chocolate.
And a concerned citizen stopped by to ask what was I
doing. Guess they didn't notice the two by eight inch
pumpkin patrol logo on my front visor. The one I was
told to display visibly so everyone would know. (snerk).

Good chance to practice my stealth bug out and observe
procedure. Not very stealthy when locals stop by and
ask what I'm doing.

I had a bit of fun, and plan to go back for tonight,
which might have some action. Of 16 bridges, zero had
reports of kids throwing stuff off the bridge or other
suspicious activity.

Baofeng UV-5R radios tend to have low transmit volume.
I got reminded of my low audio. Need to talk loud.

We secured at 11:00 PM. Took most of an hour to get home,
my assigned bridge is in the next county over, and on the
far side of the other county, too.

As to the brake the lights, will try that tonight. One click
might help, never know.

Love your spell correction program. A whore year to .....

I was pleased with the UV-5R. I'd tried to tune in FM radio,
about that time someone drove by adn rolled down the
window. It was the guy from the next bride over. I'd missed
the last check in call for the evening. Oops. Not going to
play with features, tonight.

A couple folks suggested Hot Hands things from the sporting
goods. I'm going to buy some today, and try em out. Should
have some around here, but not sure where.

BF transmit audio way low. Need to get close, and get loud.

Yuck! In my 72 Hour kit, I keep some cans of Hot Can brand Self heating Hot Cocoa. I also keep a few cans of Hot Can soups. At $3 Bucks a can, it can get kinda expensive, but that Hot Chocolate sure feels good going down on a cold Winter night!

Yes I would look into the TYT MD 380

Great radio.

However, they are UHF DMR/Analog UHF

Craig on this list is a TYT dealer and can explain more about them for specific details.

I have been talking to my buddy using the DMR gateways- when before I could never reach him in his valley location. With the World gateways I could talk to you if you had the same codeplugs for access to that system.

You then have the ability to run normal Analog FM too with 1000 channel memory. Cannot beat the price for an under $200 DMR radio using Mototurbo.

Congratulations, Amy. And yes, the General class test is quite a bit more than the Tech.

Now that you've been bitten by the bug, you know you're going to start going back to those ham test websites "just to look" at the general test questions. You'll be ready for the General by the end of the year and going for Extra in the Spring. Extra isn't really worth much in terms of the increased privileges, but the bragging rights are worth it.

DO CONSIDER the UV-B series!!!! I have owned five of the various UV-5 series radios, all being refereed to my others as having "better transmit audio." As a result, I had progressed to the various "new models" that had these questionably positive reviews... (Please note: I have service monitors here, and it was VERY hard to get close to 5 Khz of TX deviation!) Only if I would use an external mic, could I get "normal performance" from the five radios that I had.

I bought a UV-B5, and had tremendous TX audio, compared to my past UV-5R variants!!! I did not like the rotary knob that duplicates the UP-DOWN keys, so I sent it back; -I got the UV-B6, which dropped the (problematic) rotary knob, and I got the LED back! The UV-B6 also has very nice TX audio, so I am pleased. (I bought a spare at under $27 from Amazon...) My UV-B6 radios easily get 5 Khz deviation, and the audio is "fuller sounding."

One of the best things I know for keeping warm is cayenne pepper. If you don't like the heat of a half teaspoon of it going down your throat - buy some double O caps and fill them up. It is fantastic for creating heat in extremities and we use it when tramping in the snow and where your feet and boots get wet. If you suffer from cold feet a lot in normal day/night time - put a 1/4 of a teaspoon into in your socks (not too much or you will have to cool your feet off!). Shake it about in the bottom of sock, where you want the warmth, before you put it on and in a half hour you will have hot toasty feet - warm enough to warm your cold hands by :-)

Do this while operating your UV-5r (keeping my post on-topic)

Yes, I agree the TYT MD380 is a great radio for those that want to play in the MotoTrbo world without paying Motorola pricing, plus you can get a cable and software easily, whereas it's a pain to get actual Motorola software to program ham friendly code plugs.

> BF transmit audio way low. Need to get close, and get loud.

There is a lot of variation among BaoFeng radios, even with the identical model. Some are just better/worse than others; but SOME do have actual faults that can be corrected. Take a close look at the tiny hole for the microphone. Some radios have a tiny bit of flash from when the case was molded partly (or completely) blocking the hole. It is also possible to VERY carefully open up the hole a bit with the tip of a drillbit spinning it between your fingers. Be careful to not go through the hole and hit the mic element (some people prefer to disassemble the case, but that has other risks trying to get everything back together).

Most (but certainly not all) speaker mics give somewhat better audio than the build in mic. If anyone in the club has a speaker mic that fits this radio (the same as a Kenwood) you might ask to give it a quick try to see if it helps.

Replying only to what I see in my preview pane.

Last night, we had more than one unit with low audio. And then there was a lot of noise on the repeater. Well, we got through some how. I did try simplex, but my HT didn't reach the net control (who was on a base with roof antenna). There was another repeater available, but we didn't try to get 20 units moved over with less than an hour remaining.

Not sure why you put old text in my preview pane. Sure is
easier on me if you top post the new text rather than put
the new text out of sight where I can't see it.

Somehow, I did manage to make it through the end of
Pumpkin Patrol. The night was uneventful. Someone
hit a skunk, some miles away and that was noticable.

Thanks, that's a fun idea. As it happened, last night wasn't cold enough to need that. First night, I did wear a hat for a while. Second night wasn't too bad. Or maybe my body is adjusting. The goody patrol stopped by about 10:30 PM or so, and brought me a mildly warm hot chocolate.

Does Chirp support this model? It is being advertised as the "2015 model" which we know can just be hype. What firmware version have you found in yours? Just curious where it falls in the succession of UV5Rs...

Thanks

DO CONSIDER the UV-B series!!!! I have owned five of the various UV-5 series radios, all being refereed to my others as having "better transmit audio." As a result, I had progressed to the various "new models" that had these questionably positive reviews... (Please note: I have service monitors here, and it was VERY hard to get close to 5 Khz of TX deviation!) Only if I would use an external mic, could I get "normal performance" from the five radios that I had.

I bought a UV-B5, and had tremendous TX audio, compared to my past UV-5R variants!!! I did not like the rotary knob that duplicates the UP-DOWN keys, so I sent it back; -I got the UV-B6, which dropped the (problematic) rotary knob, and I got the LED back! The UV-B6 also has very nice TX audio, so I am pleased. (I bought a spare at under $27 from Amazon...) My UV-B6 radios easily get 5 Khz deviation, and the audio is "fuller sounding."

53683. Pumpkin Patrol night two of two, October 31, 2015

Yahoo group: baofeng_uv5r (2015)
Date: 2015-11-01 13:37:30 UTC
From: Christopher Young
Topic: 53683 Message: 53683

Enroute to the bridge, I noted a car with a
flat tire. Pulld out the cell phone, the operator
thought it might not be in her county. We guessed
which county it was, and got it wrong. Had to try
a third county's 911 system to get someone who was
willing to send someone out to check on em. Not
sure, maybe I ought have stopped to offer help.
I can change tires, and do have a little compressor.
Well, it's done now.

Arrived at the bridge on time, allowed some
extra time to get there. Distance was much
farther than I remembered.

With the change off Daylight Saving Time, I
stopped by the church and changed about 25
clocks and put in 25 batteries.

Listening to the radio net helped keep me awake.
Also made a couple calls on my cell phone. Nice
to have cell service, out in cow country. Verizon.

A couple of the other bridges reported visits
from State Police, to chat and say thank you.

One vehicle needed a jump start. Last night one
also needed a jump. I didn't write down which
bridge last night, but think it was different one.
Must be dead batteries are an issue with amateur
radio operators. The operator with the dead battery
was five minutes from home. The roving goody patrol
driver jump started his vehicle. Then he went home
to get other vehicle, and a handi talkie. I don't
know, but it might been corroded terminals. At least
one friend of mine had that issue, and it was cheaper
to clean the terminals than replace the battery.

Fortunaely for me, car battery wasn't an issue. I'd
recently cleaned the terminals, and the truck started
when needed.

I'd left some keyrings and keys with Steve, across
the street. He said they gave away nearly all of
them, had a lot of trick or treaters tonight.

Goody patrol stopped by about 11:00. We were busy
chatting at the top of the hour, and I turned down

my volume. Missed my check in. He left, and I turned up the radio in time to catch Net Control wondering where was I. Talking about sending the guy from the next bridge over, to check on me. Oops. Well, that's the second night that I missed a check in, some how.

Near the end of the evening, the repeater got a lot of noise in with the radio traffic. They considered change to a different repeater, but figured with an hour left of patrol, not to bother. I had the other repeater in my HT, and monitored.

On my 1998 Blazer, if I push the parking brake and start the engine, the exterior lights stay off. Release the parking brake, and all the lights come on. Nice to have some heat, and night vision at the same time.

It did not get cold enough for me to use my Hot Hands, from the sporting goods store. Though I ought have sacrificed one for testing.

Got back home, rather late. Steve and a couple of fellows were out back with a fire in the fire ring. Drinking beer, getting cancer, and enjoying each others company. I had about ten keyring left. I did ask for treats, and Steve gave me two candy bars. No damage to my trailer, fortunately.

Top posting was invented by Microsoft when the "engineers" developing outlook were too impressed with working for Bill Gates to bother seeing how every email program before that worked -- in a way that made sense by enabling people to follow a conversation.

But you are right, top posting works best for people who either don't realize there is more to email than the preview pane (and who don't know what scroll bars are)

OTOH, it demonstrates a great public service use of Baofeng transceivers.

The “holiday” is over, so the topic will close.

I kept my UV-5R at hand, along with a BF-888s, even though I was not patrolling.

Here in AZ, we don't dial 911 unless we have a "real" emergency (which certainly does not include a simple flat tire). Enough of the Pumpkin Patrol nonsense already.

<<<Here in AZ, we don't dial 911 unless we have a "real" emergency (which certainly does not include a simple flat tire). >>>
Likewise, If "I" were to hit 911 with a flat tire call, I'd forever be on dispatch's "spammer" list and could probably expect increased "surveillance" by SO and PD traffic units for a while. And they know me already as a first responder in another service. :-(
All dispatch centers have non-emergency numbers for that non-life-threatening stuff. We should all be aware of our area dispatches' non-emergency numbers for little things like this.
Our ham radios like the great little uv5r does give us a lot of extra capabilities at the right time if we learn to use them.
Like for instance, calling a local station on what ever repeater you can reach and having THEM call the flat tire in on the non-emergency number if you don't happen to know it.
  Our better yet, ask the local ham to look up the number, pass it to you, and YOU can call it on your cell IF you have cell service -- especially if you are at the scene.
All that said, and now getting back to the main purpose of this group, I have a general question to the group.
Has anyone here used an amp such as one of the Mirage series with their -5r ?I wonder what kind of perceived match can be gotten between the RF out of the 5r and the input of the Mirage amps.I'm thinking of using a 5r as an APRS beacon unit in my mobile due to the low cost of the little gem and bumping the output up to 25 or so watts would help a LOT out here in REAL "cow country" (Western South Dakota- where towns are often at least 30 miles or further apart). I had my Baofeng tested at Dayton hamvention by the ARRL techs. It barely passed, with the comment that the spurious radiation on all the harmonics were so high that it should not be feed into an amp.

From: Dave Jeffries
Topic: 53683 Message: 53695

Good call, I likewise blew it.
The 5r is heavy on harmonics, eh ? Darn, well I guess I'll have to dig out one of my old IC-2ATs from the '80s. 2 watts, no tones, good receiver. but require a step-down power supply because 12 volts is too much for them.A lot of them were used as packet nodes back when packet was BIG. From: Christopher Young
Topic: 53683 Message: 53696

Posters who leave five trailing messages should
have thier UV-5R taken away and then be taken
out and shot.

I wonder what would have been the reaction if I called
net control to report the flat tire vehicle? I wonder if
they would have told me not to bother them with
simples, and to "go direct" and make my own call?

I still have my IC-2at. Gave up using it because of the lack of ctcss . It ran my packet node for many years after that.

53698. Battery Problem

Yahoo group: baofeng_uv5r (2015)
Date: 2015-11-02 12:49:16 UTC
From: dkj_2000@...
Topic: 53698 Message: 53698

I bought my Baofeng UV-5R with the extended battery BL-5L (3800mAh) less than a year ago. Even when fully charged the radio sometimes gives the message that the battery requires charging, sometimes the screen is blank, but radio is working, sometimes the radio just dies, turning the radio off and on does nothing. Removing the battery and reinserting it sometimes resets everything. When I remove the battery, reinstalled it and things are working the voltage drop during transmission does not seem excessive. Has anyone had this problem? Does it sound like battery circuitry problem or a lithium battery problem? Or is it a problem with the radio? Does anyone know how to take the extended battery apart?

cheers,

David

I put a tone boards in my IC-2AT and IC-4AT then retired it for an IC-2GAT.

I now use my UV-5R with the large battery, speaker mic and the long antenna.

53700. Re: [baofeng_uv5r] Battery Problem

Check to see if the battery clip screws are in and tightened. I had a radio that turn on and off requiring the battery to be put back in due to the contact on the battery terminal to radio was making partial contact because the screws were missing causing that partial contact.

You might still have a batt problem but the shutdown and insert batt prob might be loose or missing screws

Hello, I am very new to using the BAOFENG UV-5R Scanner/FM Receiver/Flashlight/Transceiver/Emergency Beacon/Personal Alarm Module.

I confess i originally purchased it for the neat-o scanner capabilities. But in learning how to program this unit I stumbled upon your group and am very excited about the prospect of obtaining my HAM license.

I have spent hours trying to find out what I need to do to accomplish this objective.

All I can find is a saturation of data from gov sources that is frankly difficult to find step by step info on how to get my license. The private sources are all bull crap pay sites that promise to prepare me for a test.

My questions are:
1) What are the step by step measures I should take to prepare for my license?

2)What manual or reading material must I read to prepare for the test?

3) Is there actually a test and is it as easy as the DMV?

4)Are there any private groups meeting in the Humboldt county area?

5) Is there any online resources that are specific to this objective?

Thank you in advance

---Darwion

I can highly recommend
HamTestOnline™ - Study Tips for the Ham Radio License Exams
You can try it for free. They provide reference material for the questions so you can understand the answer rather than just memorize it. And their learning method concentrates on your weak areas and determines when you are ready to take the test.

The Technician test is quite easy...and can be simply memorized which is what a lot of people do. If you're excited about the hobby you'll find a class is better or a few online places like the one above will help you learn more...and the one above I would say is better than a class since you can spend as much time as you want to study and learn.

Check www.arrl.org for info. There should be lots of info on what is required, a list of ham radio clubs, and reference books. Most ham radio clubs offer free classes you can take. The test is 35 questions, you must get 27 correct. There are practice tests you can take online.

Here's another vote for HamTestOnline! I used the site last year to study for my General and Amateur Extra upgrades (100% score on both exams :-)). Compared to other online test-prep sites I tried, I liked this one the best because it offered more than just test question/answer memorization. The site also includes a lot of background information about why particular answers are correct, with lots of topic-specific external links for more in-depth learning.

As mentioned, the site keeps track of your progress and focuses attention on your problem areas. You can concentrate your study on specific subject areas via configuration.

The study method used may not be for everyone, but the first 50 questions are free, so it's worth taking a look. The sample tests are free for all. (There are many other sites with free sample tests, but I preferred the format presented on this site the best. Of course, your mileage may vary. ;-))

73 and good luck!

Compared to an actual scanner, the UV-5R is actually a poor example of a scanner, primarily due to it's s-l-o-w speed and lack of digital capability for the newer P25/trunking/800 MHz and higher frequencies and modes being used by most public service agencies.

If you want someone to lead you by the hand to get your amateur license, I suggest you search the ARRL website for a club near you (http://www.arrl.org/find-a-club) and check with them to see if they have classes available, and if so, at what cost.

No, the training and testing required for your amateur license is slightly more difficult than standing in line at the DMV and having your picture taken (although based on some of the questions/discussion on this forum, some would argue not that much more difficult).

Kind of tagging onto and old question but found it was along the line of what I was looking for. I was wondering if the Reverse Beacon Networks would pick it up just so I could test signal strength? Then just use software to generate the tones enough to send what's required for them to pick it up. It would be really like a one-time thing mostly. That or at least very rarely.

Thanks

As far as I know…. the Reverse Beacon Network only functions on HF. If you want to check out an HF rig, it’s a good resource.

With tone modulated FM, be careful of over-modulation... causes many spurs, harmonics and key clicks, which are illegal. Which doesn't seem to be of much concern here..

Key clicks are a problem anytime a carrier is started/stopped. I doubt the handheld has any filters to suppress it..

Either of the above may cause concern/problems to other operators and especially repeater ops.. being a good 'radio neighbor' is as important as being a real neighbor.

Yes. In the Yahoo! web interface (But you can still have it still include the original post as I have).

But for those that participate using email (and I expect most do), the previous messages are automatically included and you have to manually remove anything that you don't wish to be repeated.

HI, and welcome to ham radio.

I recommend the Ham Radio License Manual. Rather than memorizing a bunch of stuff that won't mean anything to you, this book will lead you through the actual material, so you emerge with some understanding of the hobby and the technical and legal aspects of it.

Yes, I know it's a lot of work to get to use a walkie-talkie. But the entry license, the Technician, grants you much more than that. Indeed, getting a ham license to use a Baofeng is like getting a driver's license to ride a moped - required by law, and also lets you do many other things. The book will explain what those things are, and that's a lot of what the test is about.

The test covers some electronics theory, some radio theory, rules, regulations,operating procedures and "how to". Memorizing the 400+ questions and answers in the question pool is certainly possible, and sadly, many do, but your enjoyment will be improved if you know and understand more than you will accidently learn that way. In the event you encounter something that just doesn't get through to you, memorizing is possible as a last resort. Some people freak out at the math questions - there are easy ways around them.

There are lots of hams in Humboldt County, but you will likely eventually want to upgrade so you can use more HF privileges, and talk to people further away than you can on two meters.

a/ Absolutely

b/ (If that's the model I think it is) Not exactly - but they can be made to fit well enough. All of the UV-5-Anything variants have the same electronics inside but some models have slightly different cases. In some cases, the only differences are trim, but several models have cases where the bottom of the radio is slightly different from the standard case. The difference of the bottom of the case makes the extended battery not fit properly. Generally the radio or the battery can be filed down slightly to make it fit well enough to use. When this is done the battery usually does not lock SOLIDLY in place but it will make contact and will work so long as you don't treat it roughly (a case is a good idea when using a battery that had to be modified to fit)

Anyone have any experience with the UV5R5 model advertised as the 2015 model on Amazon? I ask because it makes the grandiose claim that it has much better selectivity than other Baofeng radios. At least I think that is what it means... Specifically it says "Contrary to other radios, the new UV-5R5 is perfectly capable of handling strong out-of-band signals"

Yes, of course I am skeptical. In the Ask a Question section where sellers have responded as well as customers the question was asked what firmware these radios use. One seller responded with PL information. Language issue, apparently.

Somehow I doubt that in these troubled times for Baofeng that they made marked improvements in the front end design.

Assuming you are using the web site, you will notice in faint letters at the bottom of the white box is "Show Message History" with little drop down arrows. Click it and all the previous history appears. Then you can cut out whatever you want to trim it down and what is left will be all that appears under your reply.

I used http://hamexam.org/ http://hamexam.org/ and really liked it. It was free and I passed my test Saturday. I knew nothing about radios, antennas etc and studied for less than a week and passed. Still lots to learn but it's a start. :)

Google Ham Radio test for your area and you will find somewhere to take it near by.

Many Chinese sellers make various claims that are not 100% factual, but many buyers continue to fall for the hype as they all want to believe their radio is magically different (and better) than other similar priced models from the same manufacturer. Aside from the plastic molds or colored buttons, all UV-5R radios are "basically" the same inside (when comparing new models direct from the factory and not something that may have been sitting on a shelf for 12 months waiting to be sold, or someone else that simply returned their older radio to Amazon months ago and now it's being shipped out again as "new"). In those two specific cases, the versions may be far enough apart from true factory new product as to have some differences in performance.

Aaah, that's the secret! When I opened the radio I saw the channels had been imported and wondered what I had missed. Thanks for the clarification. I think there is a little "polishing" for me to do but this file saved me a mega amount of effort. Andy

For tidal Thames work the requirement for a narrowboat is "an FM radio". So far as I can see there is no need for a fully fledged DSC (or is that DCS!) - capable radio. So as long as I am licensed (I am) and the apparatus is too, as a portable apparatus (it is) seems all is legit. Sure, it'll sink if I drop it in the water, but it will strapped to my body so if it falls in I am already in deep trouble!

In the US, the radio is not legal to use on Marine Band. Check with your countries Radio Frequency (FCC Equivalent) about their requirements.

They are almost certainly talking about the chipset improvements that were made about a year ago - which do offer some (slight) improvement

Bottom line is simply that no matter what model number a wholesale buyer pays BF to put on the radio, they all have the same guts inside.

From: mailto:baofeng_uv5r@yahoogroups.com

Anyone have any experience with the UV5R5 model advertised as the 2015 model on Amazon? I ask because it makes the grandiose claim that it has much better selectivity than other Baofeng radios. At least I think that is what it means... Specifically it says "Contrary to other radios, the new UV-5R5 is perfectly capable of handling strong out-of-band signals"

Remember the radio to radio cheapo "repeater" device that we spoke of a few weeks ago ?
Well I for the extra low "cost" I ordered one to see what it would do.
Broke it out of it's package today and rounded up a '5r with the intention of testing it out.
DOESN'T FIT.
The mic/earphone plugs are of the wrong size for baofengs, wouxuns, yeasus (FT 530), and ICOMs.
Now I really wonder what they WILL fit. Oh well cheap is what cheap gets. Dave J AF0DJ

We (SC Forestry Technicians and also ham radio ops) have found the UV-82C
to be a much better radio, albeit in the same 'series' operationally....
We've beat up a couple of UV5r's for a year, they work but the 82 is a
little more rugged and has a better receiver for what we do here in SC.

Yes, I would agree that both the UV-82 and the B5/B6 series have their benefits, but the lack of truly extended batteries on both have caused me to not use either as much as I could. (I do like the 10W TYT UV8000D, which ships with a 3600 mAh battery), but I still wish it had more memories like my Wouxun KG-UV8D radios).

In any case, the original question was if there were any real difference between the various UV-5R cousins (comparing new factory stock to new factory stock). As expected, there's really no major differences (other than plastic changes and colored buttons). We'll probably see this same question again the minute another seller asks Baofeng for a mold change (in order to be able to announce with great fanfare another "newer" model of the UV-5R family).

I bought a UV-5R in 2012 and a UV-82 in 2014. I bought the 82 because it supposedly had the improved chipset. They both have the same piss poor receiver performance. Earlier this year I opened both of them to see what was inside. They both had the same version SDR transceiver chip, RDA1846S, which is supposed to be the new one.

Tom

A common issue, Tom, as few sellers actually keep track on their radio's firmware level (and certainly not Amazon or e-Bay), so even though you assume it's "brand new" it may not have been.

We had a programming customer approach our booth at last week's Tucson gunshow that wanted us to program his "new" Amazon radio for him, his radio's rev level was at least a year old, maybe older. He didn't believe our radios were really "newer" than his until we showed him his radio's firmware level and then ours.

I'm sure he (and his two friends - all new to radio) probably thought we were spinning a sales yarn because his Amazon radio was only $30 delivered (and ours weren't). Of course our standard UV-5R radios had the FCC Part 90 sticker and his didn't, all of our radios had the improved longer V85 antenna and his didn't, etc., etc.

Thanks all. Everything said is what I figured and yes, I agree. The UV82 line is superior to the other Baofeng line. Much tougher, fewer firmware issues and just fewer issues altogether. Add that with dual PTT and near real-time Dual Watch it it's a better rig for some purposes than the brand name radios. Add that that it is a throw-away and if it gets crushed, just shell out $35, hook it up to Chirp and you are golden again. It is my everyday HT, but I travel with my FT60 because it is actually programmable without needing a manual to add a channel.

"If" the UV-82 series had a true extended battery option and more memories (since memory is so cheap, why not?) it would be a favorite for most of my group. Not a bad choice at all for those that have no need for more memories or extended power options.

Just a word of warning.

Should you use the alarm function on the UV-5R, it will transmit on the frequency you have the HT set on.

Not if you set MENU 32 to SITE.

Exactly,

The biggest complaint is the lack of the extended battery leaving most customers to pick the uv5R series clones. The uv82 is mostly problem free unlike the uv5R which has the jack wear issues.

From: mailto:baofeng_uv5r@yahoogroups.com
Sent: Wednesday, November 04, 2015 9:33 AM
To: mailto:baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] A Better Baofeng?

"If" the UV-82 series had a true extended battery option and more memories (since memory is so cheap, why not?) it would be a favorite for most of my group. Not a bad choice at all for those that have no need for more memories or extended power options.

On Wed, Nov 4, 2015 at 9:37 AM, cprendon@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Thanks all. Everything said is what I figured and yes, I agree. The UV82 line is superior to the other Baofeng line. Much tougher, fewer firmware issues and just fewer issues altogether. Add that with dual PTT and near real-time Dual Watch it it's a better rig for some purposes than the brand name radios. Add that that it is a throw-away and if it gets crushed, just shell out $35, hook it up to Chirp and you are golden again. It is my everyday HT, but I travel with my FT60 because it is actually programmable without needing a manual to add a channel.

---In baofeng_uv5r@yahoogroups.com, <lmitchell@...> wrote :

We (SC Forestry Technicians and also ham radio ops) have found the UV-82C to be a much better radio, albeit in the same 'series' operationally.... We've beat up a couple of UV5r's for a year, they work but the 82 is a little more rugged and has a better receiver for what we do here in SC.

Amazon is sending out returns as NEW. Order a UV-82 HP (Red) from Amazon (Sold by BaoFeng Tech and Fulfilled by Amazon). Took six days to arrive via Amazon Prime, that should have been a clue that there was going to be a problem.

Opened the box and only two items were wrapped in plastic that was my second clue, items just put in box not secured, and the molded interior packaging was broken. The PTT switch on remote earphone and mike was broken, noticed black plastic pieces in bag so I checked it out.

Should have known better than to purchase a Radio from a multi-line online warehouse, well I do now.

A common issue, Tom, as few sellers actually keep track on their radio's firmware level (and certainly not Amazon or e-Bay), so even though you assume it's "brand new" it may not have been.

We had a programming customer approach our booth at last week's Tucson gunshow that wanted us to program his "new" Amazon radio for him, his radio's rev level was at least a year old, maybe older. He didn't believe our radios were really "newer" than his until we showed him his radio's firmware level and then ours.

I'm sure he (and his two friends - all new to radio) probably thought we were spinning a sales yarn because his Amazon radio was only $30 delivered (and ours weren't). Of course our standard UV-5R radios had the FCC Part 90 sticker and his didn't, all of our radios had the improved longer V85 antenna and his didn't, etc., etc.

In reality, anyone that's bothered to read the FAQ file already knows this, and it's usually discussed many times throughout the year as someone else "finds" this new feature (well at least it's new to them).

Steve,

That's a very common problem since Amazon will allow the buyer to return anything.

When Baofeng Tech first starting shipping their "new" BF-F8HP radios they had a bug that drove some users nuts (you turn off the Beep function and lose all incoming audio). BT told everyone it wasn't "really" a problem (just leave the Beep function on) so they wouldn't take the radios back for repair or replacement.

After several months they had a fix, so many folks simply bought the newer version and then returned the older radio back to Amazon in the new box. Amazon clerks look at the radio, it appears to be the same one, gives the buyer their money back on the recent purchase, and voila, the six month old defective radio is back in Amazon stock ready to be re-sold again (and again).

It's not just a radio problem either, as several friends of mine have complained about digital cameras as well.

That can be a problem with amazon and other companies as well. The great thing is they will take it back and pay shipping and send another out to you. My first UV5R had a button quit working after a few days and they sent a replacement quickly. I got the replacement before I got the other sent in. One of the things I have seen over the years with Amazon is you can return anything for any reason. If someone sends in a rig and said I just don't like it they will turn around and sell it as new. Walmart also does this in their stores as well as online.

That is a good idea actually and put the xmt freq out of band so it cannot make it via the filters. What they do here is just run in frequency mode wide open. Got another call from a local group wanting to know what was programmed in some person’s radio that they saw them using unlicensed.

Luckily I put in all scanner stuff on it with xmt disabled

BT told everyone it wasn't "really" a problem (just leave the Beep function on) so they wouldn't take the radios back for repair or replacement.

After several months they had a fix, so many folks simply bought the newer version and then returned the older radio back to Amazon in the new box. Amazon clerks look at the radio, it appears to be the same one, gives the buyer their money back on the recent purchase, and voila, the six month old defective radio is back in Amazon stock ready to be re-sold again (and again).

It's not just a radio problem either, as several friends of mine have complained about digital cameras as well.

Amazon is sending out returns as NEW. Order a UV-82 HP (Red) from Amazon (Sold by BaoFeng Tech and Fulfilled by Amazon). Took six days to arrive via Amazon Prime, that should have been a clue that there was going to be a problem.

Opened the box and only two items were wrapped in plastic that was my second clue, items just put in box not secured, and the molded interior packaging was broken. The PTT switch on remote earphone and mike was broken, noticed black plastic pieces in bag so I checked it out.

Should have known better than to purchase a Radio from a multi-line online warehouse, well I do now.

Many BaoFeng vendors resell returned radios as new -- part of the reason is that the factory does not take returns or give dealers any credit for bad radios that the factory ships -- combine that with the fact that MOST returned radios have nothing whatsoever wrong with them and you have a recipe for this kind of nonsense. Technically selling a returned product as "new" is a criminal offense (fraud) in the US, but no one cares except the consumer and people buying $30 radios don't generally have the money or political influence to do anything about it.

Then add to that the various nonsense that Amazon pulls, especially on their Fulfilled By Amazon program, and basically anything on Amazon especially if it comes from China has odds just a little better than a lottery ticket.

This it true. There are manual programming guides and videos that tell you to start out by performing a RESET of the radio. Unfortunately this results in menu 32 (AL-MOD) being set to TONE.

> Also what's a "repeater war"?

Back "IN THE DAY"..... when everyone ran crystals in single channel
converted Motorolas and GEs, (pre Standard 826MAs or Icom IC-22s)
there was only a few "choice" two meter frequencies that everyone used
.... 76 82 88 and 94.

94 being the most popular channel. (at least in my area)

Huntsville had been on 94 "forever" when the ARRL band plan started
encouraging standard 600khz splits.

A neighboring town took advantage of the fact that Huntsville was on a
non-standard input frequency and promptly put on a 34/94 and at the
same time
(plus or minus a few days) Huntsville changed their input frequency to 34.

The start of the "repeater war" !!!

Mobiles in town A and B were keying up both repeaters.

These were the days before State Repeater Coordinators or wide spread
use of CTCSS.

Escalating tensions required that the impasse be handled in a firm manner.

A 22 element Cushcraft beam and a pair of 4CX250Bs soon convinced that
interlopers that they didn't need to be on 34/94.

Lesson learned, they changed to 76.

End of war, and everyone lived happily ever after.

And That's the Way It Was .....Forty Years Ago.

Yes, we also had three guys at an AZ event a few weeks back that were asking all kinds of questions about using a UV-5R on DPS frequencies (our state police). Our course none of them asked about PL tones or offsets, so I showed them a UV-5R listening to one DPS repeater. I hope they enjoy their new scanners ....

Hmmm. It would require software to expand the band limits, but once it was done, this would allow a person to program TX inhibited channels in-the-field.

For example, if CHIRP was used to set the upper UHF band limit of a UV-5R/UV-82 type radio to 600, Then any channel programmed from the keypad could have the TX frequency set to 600.000 MHz (the radio won't TX when set only a little bit about 520.000 MHz).

Without the frequency expansion, you can't key in a frequency (RX or TX) that is out of band.

In my 12 yrs at RS and 5 at Walmart, just about every piece of electronic gear had the serial number on the outside of the box. Why can't this be done with these radios? For the swap meet people, check the package and write it on the box.

That sounds simple enough, the problem is that it doesn't work (at least not at Amazon). Baofeng doesn't record UV-5R serial numbers on the box (don't want to be accused on being off-topic), Amazon doesn't open UV-5R boxes and gets the serial numbers off product to write them on the box, and nobody at Amazon even checks to verify that a serial number on a box matches what's on the electronic item (when the manufacturer puts them on in the first place). Simply put, it chaos and some folks will always take advantage of chaos when the opportunity presents itself.

From: bnsf_railfan@...
Topic: 53781 Message: 53781

I FINALLY GOT MY RED BAOFANG UV-5R+ AND OTHER RADIO PROGRAMMED. THIS IS WHAT I DID.

WITH THE RADIO OFF.
1. I PLUGGED THE USB CABLE INTO THE COMPUTER.
2. TOOK THE 2 PLUG, PUT IT INTO THE RADIO.
3. OPENED CHIRP.
4. TURNED ON THE RADIO.
5. DOWNLOADED THE INFO FROM THE RADIO INTO CHIRP.
6. ONCE IN THE COMPUTER.
7. TURNED OFF THE RADIO, LEAVING ALL CABLES STILL CONNECTED TO THE COMPUTER/RADIO.
8. THEN. WITH THE RADIO CHANNELS ON MY SCREEN. ALL I DID WAS MAKE NEW FREQUENCY'S ALREADY OVER THE NEWLY DOWNLOADED CHANNELS. "IN THE SAME WINDOW".
9. ALL FREQUENCY'S HAVE BEEN COMPLETED. DO NOT CLOSE PROGRAM OR SAVE. LEAVE STILL OPEN. NOW.
10. TURN ON THE RADIO.
11. BEGIN UPLOADING YOUR NEW CHANNELS TO YOUR SAME RADIO.
YOU SHOULD HAVE NO ISSUES. THIS WORKS BEST YOU DO IT RIGHT. JUST FOLLOW THESE STEPS.

P.S. SORRY FOR THE CAPS. THIS IS THE WAY I USE TO TYPE :)
HOPE THIS HELPS.

After step 7 I would have saved the very first unedited download to a file to be kept in a safe place as a backup (just in case something happened in the future where the original file would be needed to restore the radio back the way it was when it was first received). Only after that was done would I have continued with step 8.

And also save the final file under a different file name so you have that available also. But you really hit the key point - download the radio, (save it), then modify that (save it) and upload it back to the radio.

Here's what I did with RT Systems software:

1) Watched the software auto-install the cable driver and the programming software on my Windows computer (anything from XP to Windows 10).
2) Asked the software to pick the local repeaters in my area (from one of four databases supported).
3) Watched the software upload those repeaters into my radio (it doesn't matter when I plug their cable into my radio).
4) Use radio after unplugging programming cable.

But but Craig RT systems cost $49 and my Amazon radio was only $30.

Can you give me free programming and tech support too?

(Imagine I am saying this standing in front of your booth jumping up and down while you have 10 paying customers in front of me, telling you to hurry up)

Yes, Rich, I can cost justify it (at least to those that value their time).

The vast majority of UV-5R's being dumped at $30 are not FCC Part 90 approved, and according to my Baofeng factory contacts in China, that means those radios failed the final QC check.

I'd bet the vast majority of folks that complain of low audio, or lack of power, or being slightly off frequency are using radios that didn't pass the final QC check. Of course, it's easy to check, just slide off the battery and look at the sticker attached to the radio. It either shows a Part 90 certification number or it doesn't. The problem with the radios not having the correct sticker is that you have no idea why your radio failed the final test, and Baofeng does not send the failed radios back for repair, they simply dump them into the Asian market, and those quickly find their way onto various Amazon and e-Bay websites, including ones that use Amazon's FBA service for faster shipping (as you well know).

You only have to look at Baofeng Tech's (South Dakota's ?) website to notice the price difference. UV-82C radios that are Part 90 approved are higher in price that those that failed and are sold as non-FCC Part 90 radios (at a lower cost).

Exactly, was told the same thing and non associated Baofeng Chinese radio sellers often complain about Baofeng’s marketing and support strategies.

I pay much higher for the 8W versions and the Part 90 stickered radios myself, it is hard to sell this model because everyone still wants it for less than $30 with full programming and some free tossed in accessory.

It is getting to the point I am trying to break away from any Baofeng products at the present time.

Luckily the Zastone made clones do not have any failure issues and the Tri-power versions seem to be holding up ok.

They just are not at the $30 price range most expect them to be.

We still offer the Baofeng Part 90 approved models, but we add the better V85 DB antenna. What we don't do is waste time arguing with some knuckle-dragging, mouth-breathing radio neanderthal about his Amazon or e-Bay priced radio, or offer to test his sub-$30 radio (for free) the way the ARRL does at Dayton (where most fail BTW).

When we clear out the last of these current 5W Baofeng's (probably at tomorrow's hamfest), I doubt we'll order the standard 5W versions anymore either (unless it's a pre-paid special order for quantity), as the tech support headaches from those folks just aren't worth the trouble.

From: Xaun Loc
Topic: 53781 Message: 53791

I'm an RT Systems customer -- but their software is ONLY "worth the money" if there isn't other fully functional software available for your particular radio. (Or when the user is completely computer illiterate and unwilling/unable to read and follow simple directions).

The "Many radios to program" only supports using RT Systems if ALL those "many radios" are the exact same model. Otherwise you have to pay full price for separate copies of the RT Systems software for each model even though the software itself may well be identical beyond the model detection routine.

Since this is the BaoFeng forum, the simplest answer to programming these radios is actually the BaoFeng VIP software, which is free and works perfectly well to do EVERYTHING that the RT Systems UV-5R software does.

There are a few specific niche items where Chirp allow you to tinker with internal settings that are not accessible with BaoFeng or RT Systems software -- and, of course, Chirp is the only software that allows you to transfer programming between multiple different model radios.

From: mailto:baofeng_uv5r@yahoogroups.com

The RT software is worth the money. Especially when you have many radio's to program. My antenna cost more than the radio. Who cares.

Don't forget RT Systems comes with a real cable, and not one with fake chips inside. I don't mind buying versions of the software for different model radios. It's better and more reliable software than either chirp or the baofeng software. The tech support is First Class.

You can also pay a bit more for a "real" FTDI cable and not worry about cable/driver problems. That's what I did. It worked first time and everytime for me.

To me, Xuan, time equals money, and when you see how many hours some folks spend getting just 1 Baofeng radio programmed and the countless times the same questions are asked, it's clear that many more folks (than you think) need the extra help and/or ease of use.

Sure, many of their issues would be resolved "if" they purchased an actual Prolific, Silicon Labs, or FTDI cable, but most newbies fall into the low cost is always better trap, and then waste hours trying to figure out what's wrong with their fake Prolific cable.

So "if" you spend $20 to $25 to get a "real" cable, the actual cost of RT Systems software runs about $25 and it saves hours of frustration for the "average" user, perhaps even more for those that are functionally illiterate about computer drivers, how to set PL tones correctly, how to download and install repeaters from existing databases, etc., etc.

I don't disagree with your assessment about freeware (VIP or Chirp), but if you compare the three of them the only reason freeware wins (for some people) is their perceived lower cost (those that value their time at zero). When most folks see RT Systems in action for the first time (at a hamfest, for example), their normal reaction is "wow, I wish my software could do that".

The other "problem" with freeware is the wait time for a new radio to be "fully supported". When the 220MHz versions of the UV-5R first shipped, Chirp didn't support those radios for quite some time, whereas RT Systems supported them within a few days. I'm still waiting to see when (if ever) several of the year old TYT and Wouxun radios are "fully supported" by Chirp, and I'm not holding my breath .....

Maybe you're right that "the average user" of these radios really is too stupid to read the directions, plug in a cable, install a driver if needed, connect a radio, and run a program. Certainly much of the "on topic" traffic here would support that evaluation.

From: mailto:baofeng_uv5r@yahoogroups.com

Xuan,

I generally like to believe that most folks are of at least average intellect, but earlier today the checkout girl at a regional sporting goods store was having an argument with another employee about how far away AZ was from Alabama (she was from Washington state, he was from Alabama).

For some unknown reason she decided I would break the tie and decide who was right. As he was explaining his answer, he started rattling off a state by state progression (from AZ back to Alabama) but she stopped him as soon as he said New Mexico and proceeded to tell him that New Mexico is west of AZ and his answer (whatever it might be) was therefore wrong. He continued to correctly provide the next several states (proving, I suppose, that at least some southerners understand maps). Since it was now obvious he would win this discussion, I stopped him and asked her where she attended school and was told she graduated near the top of her class in her Washington state high school.

"If" that is true, her parents deserve a full refund of every tax dollar they spent for her education. Sadly, the dear girl doesn't have cheerleader looks (no Reese Witherspoon in Legally Blonde looks to help her out), so I imagine she will have a much harder road in life than many if her example tonight is any indication of her overall education. I'm not even sure RT Systems would want her to own a Baofeng.

Here's what I did with my RT systems software...

Paid almost $300.00 over the past year for all the different versions and cables I needed.

2 months ago the computer I used to program radios dies.

Back-up computer has no CD rom drive.

Watched the CD's sit on the desk.

E-mailed RT systems for tech support...

Watched the replies from tech support telling me to go buy something else.

Watched the CD's sit on the desk...

Watched the e-mails go back and forth and the accusatory tones from tech support and "smart" comments...

Watched the CD's sit on the desk...

Downloaded CHIRP...

Watched the program get the repeater info....

Watched the program zap the radios....

Watched the CD's from RT systems sit on the desk...

Yeah.... RT systems will NOT be getting any more of my money. Their tech support really is something.

In all fairness, it wasn't rt systems fault your computer died. CD based software requires a CD drive to install. There was nothing they could do. You DID need to buy another computer or CD drive.

For me, the ability to make the squelch work properly alone is worth learning and maintaining Chirp (which is a hassle, make no mistake). Also having multiple models and sub-models of the same radio running under the same software is a plus. I don't know VIP, but I work with some people in my club who have Baofengs as well and they're RT Systems seems to be limited in a number of ways compared to Chirp.

One BIG advantage I have seen in RT is if you travel. You can plan your repeater programming for your entire route almost automatically.

We can debate (at least THIS topic hasn't turned into an argument) the merits of each software for days, but it boils down to what is right for each person. Each has it's merits. The main thing is knowing the pros and cons before you buy RT as it is the only one that costs money.

MY VERY FIRST EVER RADIO WAS THE YELLOW BAOFANG UV-5R+ I HAVE DROPPED IT 3 TIMES NOW. THE 3RD TIME IT WOULD NOT TURN BACK ON. IT JUST REFUSED TO RESPOND. SO I PUT IN THE DRESSER FOR AT LEAST 3 TO 4 WEEKS. THEN OVER A SUDDEN I TOOK IT OUT IF THE DRESSER AND PUT IT ON THE CHARGER. THEN JUST FOR A SECOND I DECIDED TO TURN IT ON. HOLY COW. IT CAME TO LIFE. YOU TALK ABOUT RADIO WITH 9 LIVES :) GUESS I'LL BE MORE CAREFUL WITH IT NOW. NOW I HAVE 4 BAOFANG'S. 2 BLACKS, 1 RED, 1 YELLOW. YES. I'M NUTS

LATER.

I had a Ham club call the other day and bawl me out for doing a programming for someone that was seen or shown up at one of their meetings with an Uv5R clone model.

I distinctly tell everyone they need a license, I have books, USB drives, CD's and DVD's to get licensed and it explains the process. I include a DVD with each radio.. still they decided that they either do not want to get licensed- not sure if they were transmitting or just using it as a mini scanner. Table signs show "Ham Radios"

HRO and for certain Amazon does not demand a license check before selling an item, also the FCC does not require a license except if you transmit. I do not know what else to do except to perform IQ or an intelligence skills test at the table.

This is why I stopped doing programming even if they DID offer to pay for this to be done. I have know idea what they are going to do with their cheap radios.

I dislike getting calls from other Hams full of threats because we sold one of our radios to someone under the good faith they were competent and were going to get licensed properly.

The people I have turn away from doing ANY programming run the radios on the Chinese input test frequencies or just dial in numbers to use in freq mode. I am not sure what is worse, letting them use freq mode to dial in Any number or the Chinese test freqs or to do our programming that allows them to listen to some channels and repeaters in the hope they have something to listen to and will be motivated to get a license.

For the reasons above I feel that the price is way too low, the prices should be higher than a pair of bubblepack radios. Most are using them as a bubblepack radio with no intention of ever being part of the Ham community.

I would bet this describes at least 50% of the Amazon buyers.

Doh!

I'm with RT Systems on this one. If you don't have a computer capable of loading their software and aren't willing to get or borrow a computer capable of loading their software and aren't willing to get or borrow a portable CD reader, then I can't begin to guess what you think RT Systems ought to have done for you. Were they supposed to buy you a new computer? Or maybe they should have sent a technician to your house with a portable CD reader to install the software for you. Come on James, be real.

From: mailto:baofeng_uv5r@yahoogroups.com

Simple solution. what they SHOULD have done first thing was to offer me a DOWNLOAD instead of their FIRST round of e-mails basically telling me to "go buy a new computer" and "go buy a CD ROM drive".

It's simple. When I first purchased from RT systems, I specifically asked them if I would be able to back up their software in case something happened to their disk or my computer, and they said YES and that they would help me out SINCE I BOUGHT DIRECTLY from them in case of some sort of failure.

And NO... I do NOT want an RT systems technician to come over to my house, I do NOT want them to buy me a new computer, what I want them to do is to make good on their promise. I mean really... how hard is is? I gave them quite a few chances to offer a download and to make good on their promises.

Besides, I'm pretty unhappy with their software right now because the last update tree months ago that was sent out would not let me program in crossband in any of my radios. i run a crossband node at my house, and it is irritating to have to program the radio, then reprogram it in the factory software in order to get the thing to work. I e-mailed RT systems when I discovered the flaw in their update, and all I got was crickets.

So forgive me if I'm not a fan of RT systems right now. Maybe my story is the exception than the rule, but I think the thing that got me the most upset was the snotty attitude of the tech support people.

OHHH... and the only reason I started purchasing RT systems software to begin with was comments from users here who stated how GREAT it was. Personally, I sort of find the software a little "clunky" and not that clean of an interface for $25.00 on a specialized piece of software. It reminds me of the old Microsoft Access D-base tables interface from the early 2000's. I guess I was expecting more from the company than I got.

Oh well, you live and learn....

Help me out here. How can you blame them when your computer died and you have no optical drive on the other one? None of their stuff failed.

Perhaps reading the fine print in the Legal agreement ahead of time would be a good thing. Only then can you say if RT Systems did what they are supposed to.

I can also see the reason not to offer a download. Way too easy for emailing it or copying it for others, thus causing them to lose revenue.

They don't call it "fine" print for nothing. They "could" allow a d/l but maybe they're not set up for it or worried about some one ripping off their code and using clone (fake) cables, I don't know. I know some smaller laptops don't have drives and when when I got one, the first thing I did was get a USB DVD R/W drive ($40). Doesn't take up much room in the bag and cost few Starbucks coffees.

Also having multiple models and sub-models of the same radio running under the same software is a plus. I don't know VIP, but I work with some people in my club who have Baofengs as well and they're RT Systems seems to be limited in a number of ways compared to Chirp.

RT Systems supports all models of the UV-5R family that I've ever tried, including the 220 MHz versions that took months for Chirp support, but if you are trying to download a UV-5R file and upload that file into a B5/B6 version or a UV-82 series version of Baofeng radio, then you are correct, the cabling is the same but the software is different. Of course if you are trying to download a UV-5R file and upload it to a TYT TH-UVF8, a TYT TH-8000D, a Wouxun KG-UV9D, etc., you can't do that at all, since Chirp doesn't support those radios (as well as many others).

Considering the cost, Dan (and the other members of the Chirp development team) certainly deserve kudo's for all of the work they do, which is certainly way ahead of many of the various factory programming software programs I've seen from other manufacturers. Xuan is also correct, however, in that Baofeng's VIP program is quite useable (as is Chirp), just not nearly as user friendly (IMO) as RT Systems.

Most are using them as a bubblepack radio with no intention of ever being part of the Ham community.
I would bet this describes at least 50% of the Amazon buyers.

Rich, I think you are guessing far too low at 50%, probably in the high 80's at least.

I can't say how your conversation went with RT Systems, or who you got on the phone for Tech Support (an option that's NOT available with either VIP or Chirp BTW), but RT Systems has downloaded several different programs to my various laptops over the years to either fix an issue or to install a new piece of software if I couldn't wait for the US Postal Service.

It's easy to have unrealistic expectations when you are part of the Entitled Generation that believes the world owes them something

But this thread is off-topic and headed in dangerous directions, so we'd better just shake our heads and drop it.

Several years ago the Thorton's gas station chain installed new computerized registers that not only told the cashier how much change a customer got, the register had a coin machine that automatically dropped the coins part of the change, and a computer screen (about 5"x8") that actually drew a diagram of the register bill drawer and showed the cashier how many bills to take out of each slot!

THAT was silly enough, but one day I paid for a small purchase with a $20 bill. The machine automatically dropped some number of coins, and told the cashier to give me one $10 bill and some number of $1 bills. But there weren't any $10 bills in the drawer. The girl had to get a manager to tell her it was ok to give me two $5 bills instead of the one $10 -- and he had to think about it before he agreed to let her do that.

By the way, Thorton's will not hire anyone who does not have a high school diploma.

If he was half as competent as he claims to be, he WOULD HAVE backed up his software (as RT systems told him he could)

As for providing him with a custom download foe each program he bought, that isn't even close to reasonable.

The software on the CD is not the same as the software on the computer hard drive. If they had provided a download for each of the multiple programs he says he had bought, the download would normally be an ISO file that he would have to burn to a CD to install. Even if they copied all the files from the CD and provided those as a download, it would still take a LOT of skill and support to be able to make those files install on another computer that lacked a CD drive. Simply borrowing or buying a CD drive was the PRACTICAL way to resolve his issues.

Some companies do allow a free download of their software incase old software is lost. They do require a keycode to make the software operational. I even had some companies setup a one time download access to their software. It really depends on how much a company wants to stand behind their product by helping out their customers. One company, Sony, I need to connect my camcorder to my pc to prove I have their product before I can download their software. this is of course a unusual situation.

I am sure everyone has a card box of CDROM’s they collected over the years. It is always the one software package you need, you cant seem to find the original CD for it anymore.

Laptops with optical drives (CD, DVD, BR) are becoming less and less. With broadband connection speeds increasing, cloud storage, etc. Buying software is more like buying a keycode and where to download the software.

Without going totally off topic. I don’t mind paying a licensing fee if I get to try out a product for a trial period first, if it fits my needs. Back on topic. I don’t know how great the RT Software is compared to others. I guess I am one of the few who once understood the peculiar way of programming a channel, I don’t have problems saving a frequency anymore. Also call me old fashion. I prefer to see a frequency on my radio then a name. Just the way I am used to doing things.

My first paying job was a fast food counter person on a old style register. I had to figure out total prices in my head. I knew these items cost this much. I no longer had to add the numbers in my head. Doing change was also done by counting up to 100 change wise.

but this is now the 22nd century. Computers, including computerized cash registers help businesses by keeping track of credit card payments, inventory, and the cash in the register. And yes, it does help the person operating the cash register make change. Why do business owners like this? It makes the chance of a cashier making a mistake less likely to happen. People make more mistakes then computers do. The only problem nowadays is getting a Canadian coin.

NOT blaming them for computer crashing.

Blaming them for NOT following through on their promises. At what point did I blame them for my computer crashing? At what point did I blame them for their software failing?

AGAIN... you failed to read, or I didn't explain it properly.

When I FIRST got the CD's I attempted to back them up (MOST companies offer this option), The CD Image will copy to a HDD, but will not let you install it.

SECOND point, is when I first ordered from RT, I SPECIFICALLY asked them if there was a DL option available in a case like this. They assured me that it would not be a problem. (a year later... problem)

THIRD (I don't even know why I'm having to spell this out)... at what point did RT systems give me sound advice on my computer problem? They gave me NO advice, but did give me a condescending attitude. If at some point they would have simply said "We are sorry sir about your computer problem. There are a few options we can explore." When what they gave me was silence on the first issue (inability to program crossband options) and an attitude on the second (computer issue).

HEY XAUN!!!

Have you ever backed up RT systems software???

Guess what... you back it up and it won't let you install it UNLESS you have the original CD.

And I guess I should buy more stuff because it is more "practical"... How about a company that actually makes good on their promises?

Impractical to provide a DL... Are you for real??? or are you just pulling my chain? SERIOUSLY???

Look ... it is VERY simple to provide a DL.

It’s trivial to save an .ISO image of the CD to any device and you can even mount it direct with some add ons to Windows OR you can burn a CD from the .ISO file OR you can use, say, Rufus, to push it to a FLASH drive.

Many ways,

Geoff

Subject: Re: [baofeng_uv5r] Re: FINALLY! I DID IT.

Some companies do allow a free download of their software incase old software is lost. They do require a keycode to make the software operational. I even had some companies setup a one time download access to their software. It really depends on how much a company wants to stand behind their product by helping out their customers. One company, Sony, I need to connect my camcorder to my pc to prove I have their product before I can download their software. this is of course a unusual situation.

I am sure everyone has a card box of CDROM’s they collected over the years. It is always the one software package you need, you cant seem to find the original CD for it anymore.

Laptops with optical drives (CD, DVD, BR) are becoming less and less. With broadband connection speeds increasing, cloud storage, etc. Buying software is more like buying a keycode and where to download the software.

Without going totally off topic. I don’t mind paying a licensing fee if I get to try out a product for a trial period first, if it fits my needs. Back on topic. I don’t know how great the RT Software is compared to others. I guess I am one of the few who once understood the peculiar way of programming a channel, I don’t have problems saving a frequency anymore. Also call me old fashion. I prefer to see a frequency on my radio then a name. Just the way I am used to doing things.

They don't call it "fine" print for nothing. They "could" allow a d/l but maybe they're not set up for it or worried about some one ripping off their code and using clone (fake)

cables, I don't know. I know some smaller laptops don't have drives and when when I got one, the first thing I did was get a USB DVD R/W drive ($40). Doesn't take up much room in the bag and cost few Starbucks coffees.

I've dealt with similar situations with professional (i.e. very expensive) software. It's the company's means of "copy protection". Like all locks, there is a means to bypass it, but often that means of bypassing is as expensive as buying a copy of the software.

Keep in mind, that you never "own" the software as an end user... you pay a fee to license it, complete with any restrictions the copyright holder may wish to apply. Your choice is to buy it, or not buy it. No other options.

Some companies have a much more generous attitude toward the customer who purchases a license for their software, often permitting copies to be easily made. But, it's the software company's decision as to how they wish to run their business.

My advice to someone who is unhappy with the company, is to move on and many another choice. If enough customers do that, the company will fail, or change it's way of doing business.

If the software company refuses to supply a download version of their software, well, that's their choice. If they require you to have the original CD to do an install, that's their choice. If they require you to have a hardware dongle to permit the software to run, that's their choice. As a customer, you choice is to abide by their terms, or buy elsewhere.

I only use repeaterbook, you can specify the state, county and band of the repeaters to download. This is how repeaterbook works.

CHIRP does this. It queries RepeaterBook and RadioReference. I don't have a RadioReference premium account, so I don't know how it works, but with RepeaterBook you choose the area that you are interested in by selecting the State and County.

You can also use the K5EHX Amateur Radio Repeater Map (http://k5ehx.net/) to locate repeaters within so many miles of a zip code location or along a route. The results can be exported to a CHIRP compatible CSV file (among other formats including RT Systems) and imported into CHIRP.

I tried Radioreference. It asked for the xip code of the target area.... it gives you EVERYTHING. More useful for multiband scanner users than amateurs. That's why I hold a premium account there, for the p25 systems and such.
Repeaterbook is far better maintained, as users can easily submit updates, as well as individual state admins doing some legwork. They are expanding worldwide and getting started on a lot of European stuff, too.

Guess what -- that is true of almost any program if you try to just copy the files from the CD. The proper way to back up the software on your computer is to actually BACK UP THE SOFTWARE ON YOUR COMPUTER.

I recently purchased RT systems for not only my kg-uv6x but also baofeng and also purchased a digital download copy for my friends kenwood tm-v71a that he purchased for echolink I don't know what your doing to "backup" the cd but I made backups for his rt systems cd's as well as mine they work just fine and when you purchase rt systems there is a buy option for a digital download. How ever sometimes depending on what the situation or need for programming is either I do it manually or I use chirp, chirp has a few extra settings and options others don't have especially when it comes to baofengs.

Well, on your first point, there are ways of backing up a CD. Unfortunately, just copying to the hard drive doesn't work.
On your second point, IIRC, you didn't say you asked about a d/l option. Just can you "back it up". Now if they said no problem and now you can't, I could see a problem.
On your third point, well, it depends on what actually transpired during that conversation. The best solution would be to get a computer that can read CDs, fix the broken computer or put an external drive on the other one. But I don't think trouble shooting an obvious problem with your equipment is their responsibility. You have the cables and CDs and they did work. Did you ask for a d/l? You must have the CD key and maybe an order number/CC info to prove you paid for it. I don't know their present policy, but that sounds reasonable for a d/l request. As far as cross banding, that would be a tech support question. Not having used their software, I don't know but that sounds like something it should be able to do and I don't remember anybody complaining about that.
Well, if you're that unhappy about them, just sell all the stuff on eBay to get some of your money back and go a different route. I would get an external drive (buy or borrow) since that might be the simplest way. Yeah, it sucks having a machine die. Happened to me many times. I have mirrored drives and replacement DVD drives for my big machines.

>
> THIRD (I don't even know why I'm having to spell this out)... at what point did RT systems give me sound advice on my computer problem? They gave me NO advice, but did give me a condescending attitude. If at some point they would have simply said "We are sorry sir about your computer problem. There are a few options we can explore." When what they gave me was silence on the first issue (inability to program crossband options) and an attitude on the second (computer issue).

Wassim (and John),

Within the RT Systems program, you select "*File*" then "*External Data*". From there you can select the ARRL Open Travel Plus List, or RadioReference Search, or RepeaterBook Search, or RFinder Web Search (some of those options may require a subscription).

If you select the free RepeaterBook (for example) as your search tool (from within the RT Systems software), you can then narrow your search by first selecting your State, then a location (city or town) within that State, and then the radius (in miles) around that particular city or town. You can also narrow your search by bands, everything from "*All Bands*," or "*10 Meter*", "*6 Meter*", "*2 Meter*", "*1.25 Meter*", "*70 cm*", "*33cm*" or "*23cm*" (or any combination of those band selections if your radio supports those bands).

Once you select the first sort, the RT Systems software displays what it downloaded from RepeaterBook on a new screen, but you can still filter that first sort even more. If you select "*Selected Bands*" at the bottom of the RT Systems screen, you'll see additional options like "*DMR*", "*DStar*", etc. You can deselect what options you don't want (I don't care about DMR or DStar repeaters for my UV-5R radios for example), and the RT Systems software will automatically deselect what you don't want (for that radio) and update that screen.

Simply copy that screen into your original opening programming screen and continue tweaking on the programming template to suit your individual tastes.

You can sort your new programming file several different ways, including by frequency order, by name order (which is normally the repeater's call sign), or even by comment order (which is normally the repeater's location). If you decide you later want to insert a new frequency within

that file, you simply highlight the location and click the "*Insert Channel*" option (or Shift+Ins). The same is true in reverse by selecting "*Delete Channel*" (should you decide you want to delete a particular frequency).

So in very short order, I can develop a new programming file for XX miles around any location, only for the bands my particular radio supports, only for the mode(s) my particular radio supports, and sort that list any way I wish, including adding (or deleting) a particular frequency (or channel) even in the middle of the list, without having to copy and paste over and over again.

The other database selections also offer various options, if I don't use RepeaterBook I normally use the ARRL Open Travel Plus List database, which is very handy in plotting repeaters allow a particular travel route.

Hope this info helps.

Craig

From: kc8aon@...
Topic: 53836 Message: 53836

Tuned on one of my UV5R radios last night and I guess the speaker is dead as I heard nothing coming from it. Plugged in the headphone and it works normal so I guess the speaker died. Funny thing is, it worked normal last time I used it a few days ago and was working fine when I turned it off. I have a very tiny speaker in my junkbox so I will open it up this evening and see about replacing it. Anyone else had that problem ?

No, been several months since it was programmed, used it to listen to a local FM station the other night, next time I turned it on the audio was dead. Plugged in the headphone and it works normal, so will take a peak inside tonight and check the speaker and phone jack.

Subject: [baofeng_uv5r] STRONG RADIO'S.

MY VERY FIRST EVER RADIO WAS THE YELLOW BAOFANG UV-5R+ I HAVE DROPPED IT 3 TIMES NOW. THE 3RD TIME IT WOULD NOT TURN BACK ON. IT JUST REFUSED TO RESPOND. SO I PUT IN THE DRESSER FOR AT LEAST 3 TO 4 WEEKS. THEN OVER A SUDDEN I TOOK IT OUT IF THE DRESSER AND PUT IT ON THE CHARGER. THEN JUST FOR A SECOND I DECIDED TO TURN IT ON. HOLY COW. IT CAME TO LIFE. YOU TALK ABOUT RADIO WITH 9 LIVES :) GUESS I'LL BE MORE CAREFUL WITH IT NOW. NOW I HAVE 4 BAOFANG'S. 2 BLACKS, 1 RED, 1 YELLOW. YES. I'M NUTS

LATER.

I willing to bet that you did continue to use the cable that you bought from RT Systems.
I use my cable for RT software, TYT Software, and Chirp Software. The cable is certainly better than what the radio people provide.
As for the software, I bought the CD and I have the information backed up on a separate cloud. If you system goes down and you did not make the proper preparations for such a failure.....

Your lack of preparation does not constitute an emergency on their part. Time to grow up and be an adult.

I love going to hamfests and finding folks that want to sell their radios because they are "just too hard to program" and then pick them up for a song. Just got two more handhelds (one Baofeng UV-5R and one Wouxun KG-UV3D) for a total of $20.00.

Baofeng came with two batteries (standard and extended) and the V85 antenna. Wouxun had the standard battery and the AA shell pack. Both programmed up just fine. You can't beat $10 for a like-new radio from folks that have zero computer knowledge and even less patience.

Subject: [baofeng_uv5r] UV5R no audio except from headphone

Tuned on one of my UV5R radios last night and I guess the speaker is dead as I heard nothing coming from it. Plugged in the headphone and it works normal so I guess the speaker died. Funny thing is, it worked normal last time I used it a few days ago and was working fine when I turned it off. I have a very tiny speaker in my junkbox so I will open it up this evening and see about replacing it. Anyone else had that problem ?

It is the jack <snip>

No, not the jack !! Opened it up last night and the speaker had failed, show open circuit on the ohmmeter. Replaced it with one robbed from an old Walkman style headphone and it works now. Tried a little 8 ohm speaker from an HT speaker/mic but it was all muffled. It takes a 32mm round 16 0hm 1 watt speaker, the 8 0hm only overloads the audio circuit and you cannot understand whats coming from it. So I grabbed the one from the Walkman headphone and it works fine - even has better sound to it especially when listening to FM broadcast. Funny how it opened up after I shut it off and was working normal at that time.

Oh that might be an easy fix. They sell those exact speakers on Amazon.

Measure the exact size in mm and you can get them for $1 or 409 shop might have them too.

I replaced a few speakers for Pro95 scanners and it was the same speaker used in the uv5R

What's wrong with BangGood? I have ordered a lot of things there.
I never had any problems. It takes a little less than two weeks to get
the goods for me, near Pittsburgh.
They ship from duty free ports so the prices are usually good too.

I just got a uv-5r, and I am going nuts entering from VFO to memory. Everything works as it should in VFO, but when I try to put it into memory, everything copies but the offset. I looked through the archives, but I don't have that much time!!! One uhf repeater finally entered everything correctly, but the 2 meter repeaters don't quite make it. I work 2 full time jobs, so time is very limited... any quick tricks I may have missed??? TIA, Ron, n3tlq

You don't enter an offset. You enter the receive frequency, save it, then enter the transmit with "tone code" and save it. The memory position must be empty and the voice will tell if each is saved. IF you foul up, you have to clear that memory position.

Make sure you program in the transmit freq, 2mtr 0.6Khz and 440 5.0Mhz menu>27>(program Channel)>"Transmitting Frequency" should be the response, took me a bit to figure out that one. I thought as long as I set the offset and the shift direction I was golden...eh not so...

Some vendors on Amazon will cut you a couple bucks here and there for bulk orders over 5 maybe 10 depends on their reqs I just helped my club bulk order a few of these as throwaways for what we're doing.
Aka tower climb 100+foot drop breaks no big loss unless someone's standing in the way with no hard hat like a moron but most of the club seems smarter than that.
Hope that helps depending on how many you want to buy.

The following message went out this afternoon on the ARRL Facebook page. Similar messages have gone out to relevant SM's and ARRL Directors and Vice-Directors for distribution. Please help get the word out. Time is of the essence for this particular event. Thank you.
****
URGENT: CALL TO ACTION!
The Amateur Radio Parity Act bill in the Senate, S 1685, could be scheduled for a mark-up in the Senate Committee on Commerce, Science, and Transportation as early as next week. Opponents to the Parity Act have asked their members to call the Senators on the Committee and express their disapproval of the bill. Their messages include the same negative tactics and lies about the Parity Act that ARRL addressed in our recent YouTube video, "The Amateur Radio Parity Act: Separating Fact from Fiction."
If you are a constituent of a Senator on this Committee, we are asking each and every one of you to contact your Senators TODAY and urge them to support the Amateur Radio Parity Act. This simply cannot wait until later; calls from the opposition are already coming into these Senators. We need you to act NOW.
Critical states: Alaska, Colorado, Connecticut, Florida, Hawaii, Kansas, Massachusetts, Michigan, Missouri, Mississippi, Montana, Nebraska, New Hampshire, New Jersey, New Mexico, Nevada, South Dakota, Texas, Washington, Wisconsin, West Virginia.
Follow the link below for complete information on this development and a list of specific ways to help. Please share this with as many Amateurs that you can, making sure you copy this text in when you share.
Now is the time to let your voice be heard. Thank you.

Who are these "opponents", and what is the case they are making?
Certainly they can.t be opposed to the UV-5R handheld transceivers and
the antennas in general use, so one wonders why you posted this in this
group?

Easy, Tony. I'm guessing (as I didn't post it), that he was merely trying to help get the word out that things in Congress related to amateur radio antennas (that only affect the 730,000 or so hams within the U.S.) are getting push back from the real estate folks that want HOA's (that almost always prohibit any type of transmit antennas) from sea to shining sea. I had not watched the ARRL video until now, it was quite well done.

Tony it effects all of us baofeng or not or even wouxun users? Have you made a j-pole antenna? Guess?

Essentially Home Owner Associations and zoning requirements can prohibit aerial antennas on residential properties. This bill is being pushed forward to override these restrictions and allow licensed amateur radio operators to put up aerial antennas in such instances. The logic is based on the services hams can provide in emergency and civil situations when the need arises as long as they are able to have aerials installed.

That is a REALLY brief idea of what it is about. You should read it. As you can imagine HOAs are REALLY up in arms about having their demagogue like powers usurped. I am sure there are others trying to block this as well.

Some HO-ahhs even forbid a radio transmitter on a person's property. For all we know, they could work around by voting to ban transmitters. Put up antennas all you want

------ Original message------From: Craig Carnahan craig.n7lb@gmail.com... Date: Thu, Nov 12, 2015 10:37 PMTo: 'R Pryor MAEd CETsr' doopsnoop@cros.net [baofeng_uv5r];Subject:Re: [baofeng_uv5r] Amateur radio act pass it on!

Easy, Tony. I'm guessing (as I didn't post it), that he was merely trying to help get the word out that things in Congress related to amateur radio antennas (that only affect the 730,000 or so hams within the U.S.) are getting push back from the real estate folks that want HOA's (that almost always prohibit any type of transmit antennas) from sea to shining sea. I had not watched the ARRL video until now, it was quite well done.

Correct me if I'm wrong (and I probably am) but during that video wasn't it mentioned that a case went to the Supreme Court about TV antennas and small satellite dishes and the HOAs lost? I was tired when I watched the video and zoned out a bit. I can understand the reason for HOAs, trying to keep a community from going to crap but, they slip into oligarchies too easily.

As Craig said, the opponents to the Parity Act are the real estate interests who were the ones to have put the restrictive clauses into the sales contracts for people who buy property. My belief is that the prohibition against amateur antennas (of all types) was focused on trying to “control” interference with TV. Those of us who grew up in the 50’s and 60’s, were keenly aware of TVI, caused by TV sets that had “barn door” wide receivers, made worse by those who used rabbit ears antennas, where desired signals would often be weak, and the TV set’s AGC was running wide open. And, the situation would sometimes become exacerbated by amateur transmitters that were poorly designed and/or shielded.

And, some people simply don’t like to see a radio tower and a beautiful tribander antenna in the community, citing the idea that a tower would diminish “property values”. And, that’s a personal value judgement.

No one would propose that using an HT is “bad” any more than using a cell phone is bad. Both are radios. But, HF operation usually requires an antenna of some size, in order to be efficient. And, hams should simply be accorded the same “reasonable accommodation” in HOA communities as is available to those in non-HOA communities.

Personally, I’d like to use a modest J-pole antenna with my UV-5R. I’d be able to reach far more repeaters and/or simplex stations on 2 M and 70 cm. For most HOA communities, installing even -that- type of modest antenna is not permitted.
Satellite TV and over-the-air antennas are permitted, due to a Federal pre-emption of land use clauses that prohibit those types of broadcast receiving antennas. Not everyone wants to be forced into using cable TV and -not- be able to receive OTA broadcasts, so the FCC (as authorized by congress) pre-empted any rules that would restrict receiving antennas for TV.
The rules spell out the details, but in most cases, a dish antenna of 1 meter or less in diameter can be used for TV reception.
Now that most OTA TV broadcasting is digital, and in the UHF TV band, a simple flat panel antenna will do the job of picking up your local stations.

So, I would submit, that all amateurs have a vested interest in the Parity Act, even if our only operation is with a UV-5R.

I'm opposed to the act, because it gives the HOA too much power. HOA's aren't allowed to regulate tv and satellite, they should not be allowed to regulate HAM.

Right now, the HOAs have that power. The Parity Act forces the HOAs to make reasonable accommodations for Ham Radio Antennas.

Well, I'd rather have a dipole than nothing even if I wanted a tribander up about 100 ft. It's a step which could be expanded later. And just your comment could be used by the HOAs (taken out of context of course) that not all hams are in favor of this bill. You could try fighting the HOAs in court but they are funded nationally so they have more money than you for lawyers. It's the new Golden Rule, he who has the gold, rules. Reasonable accommodation means you have an antenna. May not be what you want, but you have one.

I'm not sure if TVI is the main reason for the prohibition (although I bet it was and still is one of the "reasons" given for it by HOAs). Usually it's appearance. I know of some developments where all power and phone lines are underground so they have that "natural" appearance. Even fences are a no-no, which is stupid because having free access to your property increases your liability if some one gets hurt on your property. To counter that claim of ruining appearance, some one should take pictures of ham residences with dipoles (which are hard to see) and say "find the five antennas on this property". Bet that would kill that argument.

The parity act allows the HOA to determine what is reasonable. It should
strip them of any say, like it did with TV.

Hi Bob:

I believe you are correct: the ruling was that there was a greater public interest in having options to receive TV broadcasts, as opposed to restricting the ability to receive OTA and Satellite TV. I think the FCC decided that as long as a resident (a homeowner, or condo/townhouse owner or apartment renter had a private or restricted common area where they might install an antenna or small dish (hopefully with a decent “look” at the satellites), the HOA had to permit such antennas.
You might not be able to put a dish in the middle of your front lawn, but you could put one in the back yard or on the roof in the back of the dwelling.

I have a condo down in 4-land, where the back yards and back roofs are littered with dishes. I’ll bet I could put up a VHF antenna, and no one would think twice about it. The HOA there is pretty liberal with regard to rules. In contrast, my EPA HOA prohibits outdoor wind chimes. And backyard gardens, although flowers grown in containers are OK.

The Parity Act, if it becomes law, will still permit the ban of outdoor antennas, but the HOA must have a -reasonable- safety issue or community interest (appearance) to do so. They would not be able to prohibit antennas altogether, simply because they don’t like them or don’t want them.

From: Xaun Loc
Topic: 53867 Message: 53883

Yes, Ray, many (but nowhere near all or even most) amateurs do have an interest in the mis-named Parity Act. However quite a few of those amateurs who have an interest in this bill are among the opposition.

Yes, the issues with TVI are somewhat less now that the vast majority of TV sets are actually on cable or satellite services. But, on the other hand, the antenna input isn't the only (or even the primary) entry point for RF interference with modern televisions. In many cases, the internal circuitry itself serves as both antenna and detector for stray RF. For many years the FCC has refused to consider imposing any sort of RF immunity standards for TV receivers and other consumer electronics - so manufacturers continue to pinch pennies and continue to build and sell TV's that are very susceptible to interference from all sorts of stray RF. And, consumers are generally not in the least bit interested in hearing that their thousand dollar flat screen TV is really at fault when it suffers from RFI.

Yes, there are some HOAs that are ridiculously over-the-top about interpreting and enforcing the home owners' agreement. On the other hand, Home Owners Associations consist of the home owners in the community - so their concerns are the concerns of those who own homes in the neighborhood. And, the major point that those pushing this bill try to avoid is that the restrictions in the Home Owners' Agreement are a private legal contract that each home owner chose to accept. Proponents of this bill keep trying to claim that it is impossible to find any decent property anywhere without unreasonable restrictions in the contract -- but what they mean is they fell in love with a particular house in a particular neighborhood and either couldn't be bothered reading the Home Owners' Agreement or read it and accepted it but figured it didn't really apply to them.

The problem is that reasonable people ought to be able to agree on a reasonable solution -- but UNreasonable people will never agree, and there are plenty of unreasonable people on both sides of the antenna issue. The battle isn't really about a 2m ground plane or even a dual band J-pole -- the battle is about the ham who "needs" a hundred foot tower and multiple monobander yagis on his 40'x50' lot. And, because we do have those guys, it becomes hard for the guy who really wants a 30' tower and a 3-element tri-bander behind his house.

But the bottom line remains, if you want to build an antenna farm, you probably shouldn't sign a contract that says no antennas are allowed on the property you are about to buy.

-----Original Message-----

As Craig said, the opponents to the Parity Act are the real estate interests who were the ones to have put the restrictive clauses into the sales

contracts for people who buy property. My belief is that the prohibition against amateur antennas (of all types) was focused on trying to “control” interference with TV. Those of us who grew up in the 50’s and 60’s, were keenly aware of TVI, caused by TV sets that had “barn door” wide receivers, made worse by those who used rabbit ears antennas, where desired signals would often be weak, and the TV set’s AGC was running wide open. And, the situation would sometimes become exacerbated by amateur transmitters that were poorly designed and/or shielded.

And, some people simply don’t like to see a radio tower and a beautiful tribander antenna in the community, citing the idea that a tower would diminish “property values”. And, that’s a personal value judgement.

So, I would submit, that all amateurs have a vested interest in the Parity Act, even if our only operation is with a UV-5R.

And, some people simply don’t like to see a radio tower and a beautiful tribander antenna in the community, citing the idea that a tower would diminish “property values”. And, that’s a personal value judgement.

No one would propose that using an HT is “bad” any more than using a cell phone is bad. Both are radios. But, HF operation usually requires an antenna of some size, in order to be efficient. And, hams should simply be accorded the same “reasonable accommodation” in HOA communities as is available to those in non-HOA communities.

Personally, I’d like to use a modest J-pole antenna with my UV-5R. I’d be able to reach far more repeaters and/or simplex stations on 2 M and 70 cm. For most HOA communities, installing even -that- type of modest antenna is not permitted.
Satellite TV and over-the-air antennas are permitted, due to a Federal pre-emption of land use clauses that prohibit those types of broadcast receiving antennas. Not everyone wants to be forced into using cable TV and -not- be able to receive OTA broadcasts, so the FCC (as authorized by congress) pre-empted any rules that would restrict receiving antennas for TV.
The rules spell out the details, but in most cases, a dish antenna of 1 meter or less in diameter can be used for TV reception.
Now that most OTA TV broadcasting is digital, and in the UHF TV band, a simple flat panel antenna will do the job of picking up your local stations.

So, I would submit, that all amateurs have a vested interest in the Parity Act, even if our only operation is with a UV-5R.

Hi,
I have a MacBook Pro running El Capitan and wanted to program my Baofeng HT with the proprietary software CD and cable provided. Unfortunately, that disc would not run on my system. I had to ask someone else program it from their own windows based computer. I heard about Crossover by Codeweavers and purchased it, on sale, was able to use it to access some CDs that were window based, but had no luck programming my radio. I was informed this software would not work on connections to USB ports. What software can I use to do this?

Well, I dunno about it allowing a ban for safety reasons. That opens the door to "Oh, it could have high voltages on it!" and bam, no antenna. Some of these characters could pull anything out of their butts to block any antenna, just like their arguments against this bill. Hams have been pretty crafty about hiding antennas so I don't think appearance could be a problem but who knows. If this bill passes, you'll have to disguise your garden as an antenna.

I thought that was going to be a trick question. After 5 seconds, I said, "Oh ----!". That's what the HOAs would complain about. I was thinking more in the like of a couple of dipoles, maybe a vertical disguised as a flagpole (complete with flag). Stuff like that. I never had anything that extensive. Did have a beam on the house and one one a pole next to the house when I lived with my mother many years ago. The beam here is no longer there. Getting too old to climb a ladder up a two story house for "repairs". I really can see "reasonable accommodation" as a good thing if it is, as you say, reasonable. I wonder how they would feel if some one just operated from their mobile in the driveway in a "no antenna" community?

Those that are for the extreme rights of the HOA's (and against the ARRL's Parity Act) argue that you signed a contract that gave away your fundamental property rights (forever) to the HOA board, and if they (and they alone) decide your mailbox is too high on the pole, or the pantone color shade of the house paint you used isn't right, or (god forbid) you want to put an antenna in the air outside to help maintain communications, you need their "blessing" in order to do anything on your property.

It kind of reminds me when folks would kneel and kiss the ring of their local priest, that kind of power needs to go.

HLR owns the mountain and rents tower space to commercial interests with the agreement that if they move their antennas, the tower stays (and is his). Nice deal. I think and HOA would have a tough time getting in there.

Again, I think part of the problem is that HOAs are spreading like a plague and are taking over communities that never had them. You could have had antennas up for years and an HOA pops up and suddenly you have to take them down. I haven't figured out if they are oligarchies or just plain old communism. (grin)

53896. Programming the radio

Yahoo group: baofeng_uv5r (2015)

I have been trying to program a radio for a friend of mine. I open the software and go to the drop down menu to select the radio. I select the UV5r but the software does not like it. I thought that I read somewhere that they made some firmware versions for the radio. My question is: How do I find out the firmware version on the radio?

NONSENSE!

There are only two ways for a Home Owners Association to exist: Either 1) It was established as part of the deed covenants when the development was initially established (in which case you had the choice to accept the rules or not buy there) OR 2) The home owners get together and decide to form a Home Owners Association where one didn't already exist (I have never seen or heard of this actually happening).

The power of an HOA is only whatever is covered by the deed covenants -- that is why it no one bothers forming one after the fact, because anything such a HOA decided would be unenforceable without a legal contract.

In some cases, the Deed Covenants create a HOA and give it power to create its own rules. Anyone who buys into such a development is crazy.

Actually, that is happening in New Jersey. Even in gentrified urban neighborhoods. Not as bullheaded as HOAs in new developments since you are already there but they have gotten local laws changed to make it difficult for the older residents. This has happened in Jersey shore towns. Got so bad that the older (meaning those who lived there for many years) residents started stealing for sale signs so the new comers wouldn't find houses to buy. Really got quite nasty at times. I'm just glad it hasn't started around here.

If you buy into one and sign the HOA Agreement, then you are part of the problem. Your "I think" needs repair, please.

These radios are programmed through a serial (aka COM) port. So naturally the software is written to "talk" to a serial port.

Most modern day computers do not have a serial port. To get around this, a usb cable that contains a USB-to-TTL chip works in conjunction with device driver to create a virtual COM port. There is a COM port as far as the software and radio is concerned.

I usually recommend ignoring any CD that comes with the programming cable unless the cable has an FTDI type USB-to-TTL chip. Get you device driver along with instructions to install and select it from the miklor.com website. While you are there, you can also get your programming software.

In you case, I recommend CHIRP. It can be installed and runs natively under Mac OS X.

Hi Xuan:

Well… I'm one of the crazy ones. But as others have said, it is difficult to find communities, especially new developments where prices of homes are "moderate" that do not have an HOA. There is one close by that posts signs "No HOA".. as an advertising technique. But, don't bother checking the homes unless you are prepared to spend $500,000 or more. They post "Mid-500s". But tracts like that offer maybe a dozen homes, not 50 or 100 or more.

Developers in this part of EPA seem to buy an old farm tract, which was zoned as RA… (residential, agricultural), and subdivide into lots of 1/2 acre or less, depending on the housing type (stand alone, townhouse, condo). And, the -all- attach deed restrictions and covenants.

Problem is "buying elsewhere" means going far away from where you would like to be, in most cases. Out in the boonies, access to good pubic transportation is often zero. When my wife and I were shopping for a place, -all- of the homes that were on the market at that time that did not have an HOA, had some aspect that made the home not what we wanted.
In most cases, it was that the nearby homes were in a terrible state: messy, unkept, needed repair. And, homes like that -will- affect the value of all properties in the area.

So, fully understanding that there would be HOA restrictions, we then saw homes in HOA communities that were priced appropriately (and reasonably) that were neat, well kept, and relatively new (about a decade old). While I would love to string up some wire antennas for HF operation, I can't do that here. So, I adapted, and operate in portable mode. And, that has a benefit: my station can be taken anywhere and I can get on the air in 15 minutes or less, depending on what type of antenna I deploy. Also, by being portable, I can set up well away from a lot of the digitally generated noise that often is present in today's homes. So, there is a benefit to portable-only operating.

Another factor is that we will not be living here for the 4 decades that we spent in our prior home (which was non-HOA). For that reason, the fact that this community is well kept and neat, means that when it is next sold, we won't have to worry that the neighbor next door has an old pickup truck on blocks sitting on the front lawn. (We saw that scenario during our original home search). We don't know when this place will have to be sold.. it could be in 1 year or 10 years. That's the lot of a senior couple. But when the time comes, we might well need to sell quickly. The good thing is that homes in this community sell fairly quickly. And, every new buyer puts $1K into the capital reserve fund, regardless of sales price.

My point in this is that having an HOA -does- have it's benefits. And, it's costs. What works for one person at one time, can change over time. So, as is often the case, we adjust, adapt, accept, and move on. Just part of life. Living with an HOA is not the end of the world. Like the world, it's not perfect. But, we deal with it. Call it "communist".. "trampling on individual rights"… whatever. I don't regret having moved here. It put my wife and me into a nice, appropriately sized home that we enjoy every day, and is close to

our grandchildren, the greatest benefit of all.

An HOA, in and of itself, is not necessarily a bad thing.
And I did not say that buying property with deed covenants was necessarily crazy.

Both of these are closely related to what the covenants actually say.

Yes, some recent developments have covenants that allow the HOA to make up whatever rules it chooses - which is fine if the HOA board are reasonable people -- but this is the situation where I said a person would be crazy to buy in, unless they fully expect to live in a cookie cutter community where every aspect of the exterior of their home and grounds is regulated.

For any buyer, the first step must be to read the covenants & restrictions - then the choice is easy, either you can live with those rules or you buy elsewhere. Anyone who buys into a regulated community thinking that the rules don't apply to them or that they can change the rules is simply a fool.

Well, in my community, things are regulated by the HOA, but the board of directors can and does make changes to “rules”.

It is the case here that there is a “architectural” committee, to which a home owner must submit an application to make changes to the property, like expanding a planting bed for flowers or shrubs, or adding/changing a patio. The committee almost always recommends approval, and the board goes along. But, that, in part, is because the requested change is reasonable, commonly done, and will improve the property. So, to that extent, the exterior of homes here, is regulated. And most residents here -want- it that way. But, it’s not a cookie-cutter community. There are many variations, and no two homes are identical in the community of 241 homes.

In our case, we were fully aware of the rules and regulations, and we certainly realized that they apply to all residents, including us. :)

And, even in non-HOA areas of this town, there still are rules: zoning laws, permits required for certain changes and all new construction. So, nobody gets a total free hand to do as they wish. As I understand it, there are places in Alaska where there are no rules at all. But, Alaska is too far away. :)

You don't have to join a HOA if your neighbors decide to form one. They can't force you to join. And if they try, you can put them in jail.

Yea but what happened in Greenville, SC can happen almost anywhere. A HOA formed in an older neighborhood then went to the City Council and had the whole neighborhood a Historic District. Now they can’t pain the house unless it is a Period Correct color, Can’t remodel that will change the exterior in any way, put up antennas, or do anything else that will change the view of the homes. all Enforced by the Zoning Board.

Topic: 53867 Message: 53910

As others have already stated, HOA's started out with good intentions, but all too often HOA power causes formerly nice folks to become little Napoleon Bonaparte's within their subdivisions, dictating virtually every single detail of "your" home on "your" property.

The second part (and perhaps even larger problem) is that local city and town council's tend to look for ways to reduce arguments with their local residents, so it becomes very tempting for local officials to tell property development folks any and all plans for new sub-divisions must include an HOA as part of the master plan.

That eliminates listening to property owners complaining at city or town council meetings, but it also means virtually every single new development comes with a built-in HOA (if it's located within city or town limits). So the argument of simply moving to a different part of the city or town becomes impossible to locate, as they all (by default) have an HOA (in order to get council approval for their development).

The AZ town where I live (for example) won't even consider any development without an HOA, so it becomes a self full-filling practice. Developer appears before the town for approval, town tells developer they must include an HOA agreement for approval for their project, developer wants to sell the land and houses so they include the HOA (no skin off their back), and voila, another development with an HOA and another opportunity for more little Napoleon's to play dictator.

So the argument that you can just move "somewhere else" gets harder and harder, all because HOA's are being set in place before a shovel breaks ground on the new development.

I agree that the ARRL's Parity Act isn't everything most hams would like, but it's a great first step in what will probably be a long battle to get basic property rights returned to the property owner and not some government politician or HOA bureaucrat.

Of course not. What I'm saying is that a few politically active individuals can get local ordinances changed that makes it difficult for others to live there. Let me give a bad example (although something similar has happened in NJ). Let's say a family has a driveway that fits two cars and a garage. They decide to convert the garage into another bedroom due to a growing family. Some time later, they have (and need) three cars, one has to be on the street. Now a budding HOA style group in the neighborhood uses some political clout to get an ordinance passed that bans street parking overnight. (It's amazing how little is reported in some newspapers.) Now that family needs to expand their driveway (need permission from neighbors) but the same individuals say no. Options?
Go to court? HOA group has funding from a national level (Think all the HOA fees are just for the local? Think again.) Move? That's it. Another "malcontent" has been eliminated. Most HOAs are OK but there are more new ones in established communities that are starting to do this. The options for non-HOA places are getting less and less.
I may never have to deal with an HOA but I still think the bill is a good idea for those that do. At least it eliminates a blanket "no" and forces a discussion. Maybe no towers but a "reasonable" accommodation.

53912. Need LCD display for bf-f8+

Topic: 53912 Message: 53912

anyone have a good LCD display for a BF-F8+? or for that matter, any UV=5R? I managed to break mine, cracked really bad. I have contacted Baofeng and Baofeng distributors to purchase a new display without any luck at all. I was told to send it in to have it repaired. I'm not going to pay more than the price of a new radio just to replace a display. I'm sure that somebody out there has a few radios that don't work anymore.

thanks,
KG7YTN

Yep. They sure can -- when the rest of the people can't be bothered being involved.

Just go to www.409shop.com and search for LCD. This one may be what
you need and it is $5 shipped to the USA.

Or it's done on the sly. Sometimes the local newspapers don't publish everything that's happening locally and it is hard to find out what's happening if you don't know what to look for. I wouldn't call that not being bothered to be involved. If the League or other hams didn't let everybody know about this bill, how many hams would know about it?

True, you don't have to join, but it is like voting, whether you vote or not, you still have to obey the laws that are passed.

In Kentucky, it is not that uncommon for a HOA to be formed after the development of the property. It only takes a majority (62% I think) of the homeowners to start one, and then they can compel ALL homeowners to meet their demands. I know of one case where the first person to build in a development had built a very nice brick and wrought iron fence on his property. When others formed an HOA, they tried to force him to join, he refused. The HOA passed a standard that all fences had to be of that white plastic crap and fined him. It went to the state Supreme Court, he had to tear the brick fence down. Another HOA sued a handicapped individual for having a wheelchair ramp. Feds got involved in that one due to ADA, and the HOA wound up paying over $100K in fines plus the homeowner's legal expenses. The HOAs in our state have almost unlimited power.

when will this thread die? ;)

I live in a private community with a HOA in charge. We vote people in, change the rules, etc. Our dues goes to administration, road improvements, garbage collection, snow removal, security, etc. There are people who refuse to pay their dues. They have to enter the community through the guest entrance, waiting their turn. But still use the community garbage compactors, have their roads improved and cleaned. But they cant use any of the amenities.

When I bought my house, I knew the rules going in. So I cant install a tower on my land. I have the height of the mountain anyway. When I accepted my mortgage, there was a stipulation that if there is a HOA collecting dues, I need to pay that on my own, not through escrow.. and I need to pay it.

HOA’s make sure their land doesn’t become a refuse for old cars, their houses arent being neglected and being kept in good repair.

Since we are a private community with amenities, part of the HOA agreement prohibits having private pools on our land. A couple of people do, they had them before the community went private and was still being operated by the builder/land owner. Items like that were grandfathered in.

Yes, there are also limits to type of fencing on our property. But that is more because of allowing wild life to freely roam the community. Would it look nice if someone built a 20 foot brick wall around their property? I don’t think so. Especially if it was blocking my view.

People are talking about all the negatives. How about some positives

If I didn’t want to live there, I could have bought more land for the same price as I paid for what I currently have.

No matter where you live, I am sure there is some type of zoning or local laws you need to deal with. And if you live near a airport, that limits your antenna height too.

Bruce

Whilst I kind of agree about this thread dying some time back, and also the fact that it is a UV-5R group, it is interesting from the point of view of a UK Amateur to see the kind of problems faced by you guys.

It seems much the same as what we have, except that it is all administered by the town (city) councils. And there is an appeal process if the city council stops you doing something. Which sometimes works :-)

If you cross the town council, and then don't comply with their order to remove whatever you built, they can come around and (at your expense), tear down what you did.... :-(

My antenna mast had been there more than 7 years by the time they discovered it. Tough.. It is still there

I enjoyed the read.

I get pretty much the same thing in my city.

> When I bought my house, I knew the rules going in. So I cant install a tower on my land. I have the height of the mountain anyway. When I accepted my mortgage, there was a stipulation that if there is a HOA collecting dues, I need to pay that on my own, not through escrow.. and I need to pay it.

Gee, I pay taxes.

> HOA’s make sure their land doesn’t become a refuse for old cars, their houses arent being neglected and being kept in good repair.

We have the same in local ordinances.

> Since we are a private community with amenities, part of the HOA agreement prohibits having private pools on our land. A couple of people do, they had them before the community went private and was still being operated by the builder/land owner. Items like that were grandfathered in.

Some HOAs are not as nice.

> Yes, there are also limits to type of fencing on our property. But that is more because of allowing wild life to freely roam the community. Would it look nice if someone built a 20 foot brick wall around their property? I don’t think so. Especially if it was blocking my view.

Again we have ordinances against that.

That's federal and it's not that restrictive. So, basically, we have the same thing but I have more freedom (and also the responsibility to not make it a mess) to do what I want with my property and, I assume, pay about the same (you probably have to pay school tax). Hmmm....I choose my city.
The real question is, would you support this bill?

Amateur Radio Roundtable

Subject: Future of Ham Radio

|
This week's W5KUB.com show (November 17th) will feature the James Lea family of amateur radio operators. Not only are James Lea, WX4TV, and his wife Michelle Lea, N8ZQZ, licensed but so are three of their children. The youngest child is taking her test this week and could be licensed by Tuesday evening. These young hams range in the ages from 7 to 13 and are involved in all aspects of ham radio including Satellite, DXing, contesting, portable operation, special event support, homebrewing, etc. They are highly technical and speak at forums. I interview them at 2015 Hamvention and was blown away by their intelligence, energy, and enthusiasm! The children have their own ham radio blog called HamRadio.World. Please check it out before the show, read about the outstanding projects they are involved in, and watch their videos. This is an amazing ham family and you will not want to miss this show. Invite a young person to join you!

If you watched last week, you know that we had technical problems - no Skype audio from our friend Joe Eisenberg, K0NEB, so we used a back-up phone line connection. Since Joe's kits are in high demand, we decided to postpone his presentation until November 24th. In addition to Joe's segment, we will have a segment on near space balloon launches with Jack Crabtree, W7JLC. Jack has conducted over 154 flights in the last 25 years.

Please send your FCC related questions to Riley Hollingsworth, K4ZDH, at AskRiley@.... He will answer your questions on a future webcast, and in some cases, he may just call you on the phone if you leave a number. Riley retired from the FCC’s Compliance and Information Bureau as Legal Adviser for Enforcement Program.

Amateur Radio Roundtable is a live weekly amateur radio webcast, held every Tuesday night at 8 PM CT (0200 UTC Wednesday) at W5KUB.com. The show covers a wide range of topics for ham radio operators and electronic hobbyists; including balloon launches, satellite, go-kits, emergency communications, SDR, digital modes, DXing, home brewing, hamfest updates, and more. Viewers will have the opportunity to ask questions via the chat room or telephone.

Our shows are usually recorded and placed on YouTube's W5KUB channel the following day.

We need your help. If you use Twitter, please send out a tweet 15 minutes before the show or retweet our announcement. I suggest something like "live #hamradio show starts in 15 mins on w5kub.com 8 PM CT". This should help increase our viewer base.

Towards the end of each show, we provide a link and viewers who have a camera, microphone, and a Google+ account, can join the show. Your video and audio will be on the webcast. This part of the show is very informal and up to 10 people can join. We talk about anything the viewers want to discuss.

We would like to share pictures of your ham shack on the webcast. Send a picture of your ham shack with a description and we will feature your shack pictures on the show. In fact, if you give us your permission, your shack could be used as the background of that week's webcast!

If you have a specific subject idea for a future show, send an email to tom@....

Forward this message to a Friend will allow you to share this message with your friends.

Join us for fun and interesting discussions!

Tom Medlin, W5KUB |

What was that old saying ?

A Democracy is two wolves and a sheep voting on dinner.
A Republic is a sheep with a gun.

Considering how many times folks ask about adding an outdoor antenna to their UV-5R (and other Baofeng units), I don't see this particular thread as being completely off-topic as many other previous discussions have been. In my opinion, many new hams (that tend to think of amateur radio as being completely VHF/UHF repeater based) don't always know that there are many other bands used besides 2m and 70cm, and those other bands need more than a 5.5" duckie antenna to work well.

Years ago that HOA's were up in arms over the thought that satellite dishes (if allowed) would lower property values, destroy the look of their neighborhood's, etc., etc. - none of which came to pass. I wish the FCC (and Congress) would truly step up to the plate and tell the nation's HOA's to get stuffed (when it comes to what a private property owner legally does on their own property with their own antennas and their federal license), but at least this ARRL Amateur Radio Act is a positive first step.

Topic: 53867 Message: 53928

I think there’s exactly one HOA like thing in town here and that’s in a ‘gated’ retirement community for over 55s. Otherwise you are faced with any local council restrictions (pretty much none) and State Development stuff.

For historical reasons (picking up analog tv from the state capital about 90nm away as the crow flies) every second house in town has or had a 40-60 foot tower with a 16 element phased array for vhf high band tv on it, since the early sixties. Council long ago stopped requiring individual approvals and you need only make sure the foundation blocks are made to a particular standard – they send an inspector to check the bolts before the pour – and it’s literally a rubber stamp. No development application et al. IN addition, there’s an exemption for amateur radio antennas in a portion of the State rules, which exempts you from requiring development approval provided the antenna is no more than 10m above ground or 5m above the roof of an existing structure if roof mounted. Since Federal trumps state and state trumps local government BS, restrictive councils can’t do anything about it.

HOAs do exist, but they sure as hell can’t be imposed on a freehold property just because some of your neighbours think it’s a good idea and mortgages mention nothing about HOAs – banks don’t give a rat’s anal opening about such things, so in this state at least it’s pretty easy to run up anything you like, within reason. And people have been using the towers for CB antennas (UHF and 27mhz) since the 70’s – towers are so common here no one bats an eye at one more. If you have an existing TV tower you want to repurpose, as TV here is now from local translators and digital so the ‘Adelaide antenna’ is now no longer needed, council don’t even want to know about it. Only problem is that some of the towers have been up since the early sixties and some well meaning fools have buried the footings, and grown gardens over them, causing some of them to rust out at the footing. So one or two come down every spring storm season, when the wind is bad. Neighbours went over a couple years ago, landed on the high tension lines on the side of the road and blacked out the whole section for about 14 hours. They had to get a crane to remove it before they could repair the power line so we were on genset for a while. Most people get the towers cut in half and ditch the top section and use the bottom section to mount a local UHF antenna for the digital bouquet from the Bluff about 20km away. Or get it cut off and remove the whole thing and bolt the antenna to the house instead.

Subject: Re: [baofeng_uv5r] Amateur radio act pass it on!

Considering how many times folks ask about adding an outdoor antenna to their UV-5R (and other Baofeng units), I don't see this particular thread as being completely off-topic as many other previous discussions have been. In my opinion, many new hams (that tend to think of amateur radio as being completely VHF/UHF repeater based) don't always know that there

are many other bands used besides 2m and 70cm, and those other bands need more than a 5.5" duckie antenna to work well.

Years ago that HOA's were up in arms over the thought that satellite dishes (if allowed) would lower property values, destroy the look of their neighborhood's, etc., etc. - none of which came to pass. I wish the FCC (and Congress) would truly step up to the plate and tell the nation's HOA's to get stuffed (when it comes to what a private property owner legally does on their own property with their own antennas and their federal license), but at least this ARRL Amateur Radio Act is a positive first step.

Well, I just hope it gets enough support for those who live in those areas so they can put up something if they want. An outdoor antenna for the Baofeng is problematic do to the wide band nature of it's front end with it having problems from signals from other services but for those who want to move to other bands, they should have a chance. BTW, I have to hand to some hams in G-land on the way they hide antennas. Not only are they ingenious but also amusing,

NOT TRUE....

Mililani Hawaii... HOA was VOTED by majority. The ENTIRE TOWN is an HOA. This was done AFTER people were living there, and it passed, only barely by like 60%, but are you telling me that people in Hawaii can just "move"? Have you ever tried to price properties in Hawaii?

THIS is an example of how HOA's are starting to spread and become a nuisance. They have outlived their usefulness.

THERE is your example of.... " OR 2) The home owners get together and decide to form a Home Owners Association where one didn't already exist (I have never seen or heard of this actually happening)."

Ya see, Chris, SOME of us DO read almost everything that's posted.....grin.
And anything that I don't like seeing or get bored with seeing, well, MY computer has one of these new fangled "delete" buttons on it.....
I'm just kidding guys, I know that some of ya are on MIFI devices with limited gig rates so that stuff in which you have no interest seems to be wasting your gigs.
All that said, this particular item has the potential to have an effect on all hams so it's "on topic" in an amateur radio forum as far as I'm concerned (but then again I'm NOT the moderator)
Once again, all THAT being said, I think we've pursued the subject to the point that all opinions have been heard in one form or another so If the subject went away I'd not be disappointed.....at all.

I was in Oahu last week and I spotted only one 20/15/10 meter tribander.

I did see a couple of disguised cell towers that were decorated like
palm trees with green sector panels... Maybe the hams are using thin
wire dipoles.

Hard to believe since I always hear a bunch of KH6s on HF.

I'm not a moderator for this group nor do I play one on TV, but since I enjoy being the Devil's Advocate I'd like to point out that the Group's Description reads:

" ...it <the Baofeng> is USA legal for commercial (if part 90 approved), amateur band, and any use as a receiver. "

So this isn't really a forum dedicated to Amateur Radio, even if that's *your* utilization of the HT.

I can think of three reasons:

1) The vast majority of active participants in this list either don't mind off topic discussions or actually enjoy the "off topic" discussions that relate to amateur radio

2) If there were no "off topic" messages, this whole list could be replaced by an automatic program designed to email out the entire contents of the Miklor website once a week

and, perhaps most importantly,

3) The only people who ever complain about "off topic" discussions are semi-literate (or totally illiterate) trolls who have never contributed a single useful on-topic post to this list in their lives. (Show me one rant about off topic messages that was posted by anyone who has ever provided a single correct answer to any on-topic question posted here).

my UV5RC is around 7monthds old.
suddenly it stars misbehaving , showing all 000.000 in both A and B sides.
effort to load 145.600 fails at last digit announcing "cancelled"at entry of last digit.

I am not readily having any prog cable. i suspect whether the eeprom 24C64 got damaged?

i earnestly request friends to offer suggestions.

thanks in anticipation please.

Topic: 53950 Message: 53954

Many thanks for the spontaneous response. Buying another radio, let me have it as last resort.
I had teething trouble for this unit with audio chip that went bad. After replacing it restored.

if the chirp program is to be loaded on to eeprom (24C64), perhaps i could load one externally, provided the dump starts at 0000h address and then substitute the chip.

all other functions were ok. Last ever observation was reception at 5 sec intervals with breaks in between and went qrt. There was aonther person on our site who recovered the rig way back 2013.
Perhaps he might not remember .
I shall go thro the miklor site also as suggested and keep data ready.

however i am trying to get hold of local HAMs who have such cable. For cloning, perhaps we need another type of cable that has cris cross inter wiring,
Thanks

It's possible that the EEPROM failed. Similar things have been reported
with Wouxun radios that use the same 24C64 EEPROM.
It happened to my KG-UV2D after 3 years of use and is intermittent.

See http://tim-yvonne.com/ham/wouxun-memory/index.htm

Thanks scott. I realized it while studying the way chirp is used.
Tom,
i suppose we need to pre - load chirp file into the eeprom and then solder it.
or can we solder a fresh chip and use chirp win driver to load the same?

Jim,
i fear that some section might have failed.
i am able to load parameters like TX power low , shift value and the shift sign etc and , let me tell that i have been using the handy in frequency mode. i am able to save them. except the VFO frequencies have got erased both A and B.
They now, show 000.000 and a trial to change cancels as I enter last digit, reverting back to 000.000

The chirp image (memories and radio settings) might be only part of what is stored in the EEPROM.

If you replace the EEPROM you might need to follow the same procedures the factory uses to load the firmware, set up, and calibrate new production units. As far as I know that capability does not exist outside of the factory.

From: Phil
Topic: 53962 Message: 53962

Today I needed to order a piece of test equipment for my home electronics lab. I had just a few dollars left over and decided to buy a "whippy duck" for the UV5R. I've been eyeing the Nagoya one but with the function generator order it ran over what wifey and I agreed was the "Hobby-budget" limit for this month.

In doing some research I ran across this one and overall it seemed to get pretty good reviews, so I ordered it. There are always a few 'bad' reviews on any Chinese (or other) products. My rule of thumb is to throw out the ones that just say "great product" in a couple words, along with the lower 10% or so (especially if they just say "don't buy this product"), figuring that those may be by people who either don't know what their talking about, or in some cases got truly faulty units that slipped by quality control. The reviews cover both the 7 inch and the 14.5 inch models, I ordered the 14.5 Inch one.

http://www.amazon.com/gp/product/B008Y2SPE4?psc=1&redirect=true&ref_=od_aui_detailpages00

As a side note, so far I'm VERY VERY pleased with my UV5R that I bought back in August. Unlike some that I've personally heard on the local repeater, it gets VERY good audio reports of "crisp, clear and loud". On my morning walks, most of the time it gets into the Mt Bullion repeater (25+ air miles) full quieting, with just an occasional drop-out when I manage to get in between a couple mobile homes.

Most of the time I use the 440 input to the repeater as it seems the best, at least on the short factory duck. However, occasionally I don't get into the repeater that well on 440 and I've figured out that it's most likely due to "ducting" from an inversion layer as those are the days that the digital TV also has problems with a lot of the channels (UHF over-the-air TV) dropping out.

That's the main reason I'm ordering what I call the "whippy-duck" as hopefully it'll give just a bit more oomph to my signal.

But I have NO complaints at all about the radio, 26.00 for the radio and another 11-12 for the "phony-baloney programming cable" & software (I use chirp instead) and the speaker mic that I've only hooked up once to check out.

Someday I hope to be able to get another Yaesu FT-60 (it was my favorite HT), but IF I can't, I'm certainly having fun with the UV5R!!

On multi-band repeaters, I program the memory to receiveon the 440 side but put the 2 meter input for transmit.This allows the "better" 440 receiver to hear and gets inon the "better" transmit, as 440 needs height and high gainbecause it's more line of sight then VHF.

At, Hyderabad, India, we have a VU2LCH amateru club repeater and it is on 145.6 with negative shift.
Thus we use it .
the cove rage is really good , reaching 130KM in some directions.
People say they could trigger the R/Rfrom a place 140Km away with 5 watt power.

I do use a slimjim designed for 145MHz. I used PVC water pipe and 3/20 swg electrical copper wire . It is covering around 15Km directly even.

I had very bad experience and service from 409.com. I got a defective radio then got a bad replacement for it. If you pay return shipment twice, you spent more on postage than the radio costs!

About a year or two ago, these were basically THE standard recommended replacement antenna for the UV-5R.

They probably are "fake" in the sense that most Chinese products are manufactured by the same dozen factories that make the "real" product but are sold directly on grey market instead of through the official company. Almost all of them consistently worked very well.

53971. input of frequencies

Yahoo group: baofeng_uv5r (2015)
Date: 2015-11-19 12:04:48 UTC
From: Richard Sparks
Topic: 53971 Message: 53971

I am very new to all this, and I have just bought a pair of Baofeng UV5R+ A very nice radio I must say.

This probably sounds like a stupid question, and you have probably been asked this a million times, but im going to ask anyways.

I have looked up on the internet frequencies for my local Fire Brigade, Ambulance, things like that. The website is telling me that the frequency is 413.1125, but my radio only has space for 6 digits, not seven. Is there something totally obvious that I am missing here?

Many Thanks

The radio only accepts 6 numeric digits from the keypad and rounds down.
The step size must be set correctly. In this case 2.5, 6.25, or 12.5 kHz
will work.
Then you must use the up/down arrow keys to get to the final digits.

Tom

To enter 413.1125 key in 413.113 and with a step size of 2.5 it will round down to 413.1125. So any time you have 4 digits in the decimal point just enter the next highest digit in the 3rd digit.
If you look at the display closely you will see a tiny "5" that looks kind of like a subscript so it can actually display the full 4 digits...just not enter them directly.

The radio will put in the last digit for you. Best to use the chirp software and you can program in all the frequencies you want. Not very easy to do it by hand. I have my police freq in and it is 472.5875 and all of m county freqs are 7 digits.The one problem I remember is that the radio may not like the last 4 digits and may shift up or down off the desired frequency. You have to put in a freq above or below the desired frequency to get it on the desired frequency. This is one of the reasons the software is the bset way to program the radio.Good Luck

Well, first let me say I am sorry for the tardy response, secondly, I ordered from BangGood Oct 30th, they shipped Nov1St, and the last info had on tracking is from Nov 5th, and so it is all I have, they have my money I know this, yet I do not have my product, nor any info on tracking other than from the fifth. I keep asking them for an update and they keep resending the 5th info over and over. That is my issue with them, I know not all have bad experience, but also not all have good.

Impossible to get wrong with a step size of 2.5 -- you can always enter a freq with a 0 at the end directly.
Same rule applies to all frequencies...if you can't enter it directly bump up the 3rd digit. The up arrow also works when you forget to do it. The digit bump is mostly helpful when entering multiples as you'll never remember to do it next time :-)

  what if the frequency has a zero at the end.. ie 425.1000 ?

Topic: 53971 Message: 53991

Wrong. The frequency has to be divisible by the step size or you can't enter it from the keypad.

Try entering 450.00625 or 450.001875 with step set to 2.5 kHz. You need to set it to 6.25 kHz step for those.

I added too many zeros to the second one. That should be 450.00625 or 450.01875.

Hi Richard:

With most online merchants, you can cancel the order before it ships. And then, even if it ships, you can return it. Some people “refuse delivery” and it gets sent back, but I’d contact either your credit card company or PayPal.. whomever you used for payment for guidance. There’s no way you should have to keep a product you ordered “in error” an no longer want.

So… advice to noobies in any field: take your time… get additional viewpoints and realize that not everyone has the correct answer, or the proper answer for -you-. And, that includes my advice. :)

I will give that some thought. thank you. i just might keep it, i may get better reception than what im getting right now with my baofeng - which i have hooked up to a magnetic car aerial, stuck on a metal awning outside my window. seems to work ok - better than the supplied one. Can anyone see an advantage of me keeping the Uniden Scanner over what I have now?

The scanner will have better rejection of out of bandsignals, scan faster and cover more frequencies thena UV-5R. I have several scanners in addition to mytransceivers. Besides, a UV-5R won't trunk P25 digital...
As you have found out, a '5R overloads with external antennas.

I like Amazon; Good prices, free shipping and quite QUICK delivery.

Plus, easy to return, if one is displeased!
I have owned five UV-5R series, all had the "low transmit audio.
Tried a UV-B5, did not like the rotary knob.
(This was reviewed as problematic, but I ordered anyway!)
Returned the UV-B5 to Amazon.
Ordered the UV-B6. (No knob, returned the LED flashlight.)
The cost was under $27; -It is now closer to $30, I believe.

The UV-B series has VERY good transmit audio, compared to all of the UV-5R units that I have owned and have been in contact with. (UV-B series is a SATISFYING radio for the audio as well as several other genuine improvements!!)

scan rates, fast speed multi band capabilities. The uv5R is NOT a scanner regardless of the Chinese advertisements it is a Ham radio that can be tuned to frequency within a scan range and has a scanner capability to slowly scan a group of channels. This all needs setup though. most easily with software.

If you have any trunked systems,digital freqs or lower bands including AM aircraft you need a real scanner.

54002. Re: [baofeng_uv5r] input of frequencies

Yahoo group: baofeng_uv5r (2015)
Date: 2015-11-19 17:14:56 UTC
From: Xaun Loc
Topic: 53971 Message: 54002

The main thing you are missing is a license to transmit with the radio at all, and an understanding of why it is dangerous to program your radio to illegally transmit on public safety frequencies.

The second thing you are missing is a radio that will actually work as a useful scanner. The UV-5R is fine little radio (for its cost) but it makes a very poor scanning receiver.

Subject: [baofeng_uv5r] input of frequencies

I am very new to all this, and I have just bought a pair of Baofeng UV5R+ A very nice radio I must say.

This probably sounds like a stupid question, and you have probably been asked this a million times, but im going to ask anyways.

I have looked up on the internet frequencies for my local Fire Brigade, Ambulance, things like that. The website is telling me that the frequency is 413.1125, but my radio only has space for 6 digits, not seven. Is there something totally obvious that I am missing here?

Many Thanks

Actually you will be MUCH better satisfied with the uniden scanner than with the UV-5R.

The uniden will scan much more quickly, which is important unless you want to miss about half of anything that gets said on the channels you are monitoring

The uniden will let you input the frequencies directly - without have to learn how to set things like the step size - and the uniden does not have numerous other settings you don't understand which will cause you grief when you or someone else tinkers with them

The uniden doesn't transmit - which will keep you out of jail

If he wants to monitor only 1 frequency the Uv5r set to that freq is good enough as long as he does not transmit and better yet disabled transmit in software.

If he wants a real scanner that will monitor all the fire freqs, firegrounds, incident response, mutual aid, tac channels, aircraft, med engine, interops then he needs a scanner.

A scanner would be my suggestion too.

> Impossible to get wrong with a step size of 2.5

Actually there are many frequencies that CANNOT be entered with a step size of 2.5 -- those are the frequencies which require a step size of 6.25

Yes, I know that 2.5 is smaller than 6.25, but you will note that there is no multiple of 2.5 that lets you reach 6.25 -- with the splinter channels assigned under "narrow banding" depending on the actual frequency you want, you may need a step size of 2.5 or 6.25

Considering that we see one of these scam emails at least once a month - always advertising two radios, always with a new name and address, but otherwise the same sort of nonsense, I'll stand by my bet this is another con.

Also note that neither of the rigs being offered for sale matches the rigs that "Larry" has on his QRZ bio page

Hi Clay,
I've ordered from Banggood, and everything was fine, except that it did take a long time to receive my order from their CN warehouse. I think 5 weeks. Like you, I complained & thought it was lost or not shipped. Once they ship it there isn't much anyone can do until that boat crosses the sea so your package can sit in customs for a while. Sit tight, I bet your package arrives even if it is mid-December. Sort of brings back memories of how as kids we used to wait for mail orders for 6-8 weeks. An eternity.

73,

Dave Nathanson

Well, first let me say I am sorry for the tardy response, secondly, I ordered from BangGood Oct 30th, they shipped Nov1St, and the last info had on tracking is from Nov 5th, and so it is all I have, they have my money I know this, yet I do not have my product, nor any info on tracking other than from the fifth. I keep asking them for an update and they keep resending the 5th info over and over. That is my issue with them, I know not all have bad experience, but also not all have good.

I have a couple of Uniden Scanners, even a digital one. When I want to listen to my local police and fire, I use my Baofeng. I use the TDC (think that is the setting) so it just scans those two channels on each bank. When walking around, one radio solution. I used my Icom dual bander years ago for the same thing. Of course I programmed the Baofeng with software so I cant accidently transmit.

I am very new to all this, and I have just bought a pair of Baofeng UV5R+ A very nice radio I must say.

This probably sounds like a stupid question, and you have probably been asked this a million times, but im going to ask anyways.

I have looked up on the internet frequencies for my local Fire Brigade, Ambulance, things like that. The website is telling me that the frequency is 413.1125, but my radio only has space for 6 digits, not seven. Is there something totally obvious that I am missing here?

Many Thanks

54015. FCC Not Processing License and Exam Session Files Again

Yahoo group: baofeng_uv5r (2015)

From: Xaun Loc
Topic: 54015 Message: 54015

For those waiting (and waiting and waiting) for their new ham licenses to show up in ULS... The FCC Universal Licensing System (ULS) electronic batch filing (EBF) system was working for a brief window of time yesterday after being down since Friday November 13. Some files were processed through the system Wednesday, but the FCC is having a problem processing all VEC license and examination session files today. ARRL VEC Manager Maria Somma, AB1FM, said her office again had to alert the FCC IT staff, which are said to be looking into the issue but did not estimate how long the system would be down. Somma said it was the third time the EBF system has gone down since late September, when the FCC said a process had stopped running on an FCC server.

The FCC doesn't have a long term fix in place yet and it appears the same issue is happening again with more frequency. The amateur community should expect delays in exam license processing until the FCC can get this resolved. The FCC apologies for the continued inconvenience this is causing the community. "We transmit the exam sessions to FCC as soon as possible, which is usually 24 to 48 hours from the day received in our office," Somma said. "We make every effort to process each session quickly and efficiently while following FCC rules. Unless there is missing candidate information or paperwork, we normally aim to send the session to the FCC within a few days, because most of the VEC staff understands what it feels like to wait for your call sign to be issued." Somma expressed the hope that applicants and VEs will be understanding and patient while the FCC resolves the problem.

good moring all

just a silly question, I have looked at both Chirp and VIP
and didn't see a print function, I would like to read from my older 5r
radio then make a hard copy of the things stored in memory did a
export csv but it looked like the fields were missing with entrys only
showing freq name channel number, haven't tried to just import a img
file to a spreadsheet yet is that the easiest ? usually when i do
things like that it's more work than if i just re typed it all again.

thanks for your time

Nobody seems to think you need to print anything anymore.
Just try printing a directory listing from a file browser window....which hasn'b been a capbility for years.
However...export your data as a chirp file and then import that to excel. You'll get all the columns that way.

54025. Re: [baofeng_uv5r] About the power bank of handheld

Yahoo group: baofeng_uv5r (2015)
Date: 2015-11-20 16:11:13 UTC
From: Xaun Loc
Topic: 54016 Message: 54025

Might work well for jump starting your car, but it's voltage is probably too high to power the BaoFeng charger directly (despite that being what seems to be shown in the photo).

The BaoFeng charger is designed to work with approximately 10v DC input, at 12v DC input it will usually overheat and may fail, somewhere between 13-14v DC it will protect itself by turning off.

The typical voltage of a Lithium Ion battery is around three and a half volts, so the total voltage for the four cells in the Power Bank would be 14v which would result in the BaoFeng charger turning itself off. Even at 3.2 volts per cell, the power bank would still put out 12.8 volts which might or might not make the charger turn off, but if it didn't turn off, it would probably overheat.

There are dozens of threads in the archive about trying to power the BaoFeng radios or chargers from automotive voltage levels - there are ways to do it, but it is definitely not as simple as plugging the radio or charger up to a 12v battery and certainly not up to a "Power Bank" which is designed to provide more than 12v to jump start a car.

Are you saying you can use ATTRIB from a file browser window? Not sure what ATTRIB that has to do with printing a directory as opposed do DIR. Perhaps you can educate me.

I did at least find a current method for getting an action menu on the file browser to print a directory...not for users who aren't comfortable with .bat files and such though. Doesn't do any good for his CHIRP problem but already gave him a solution for that.
How to add the Print Directory feature for folders in Windows XP, in Windows Vista, in Windows 7

With a TYT base it could handle it but buying spare batteries is a much better idea.

I would get the TYT base and a good controlled solar panel around 20W or higher if you want something more exotic than spare batteries.

Most uv5R buyers would not buy any solar kits or multi powered systems. We sold them and they are a tough sell due to the cost being above $30 which seems to be the max amount uv5R owners want to spend (cost of a complete radio)

If you have multiple radios the suggestion is to use the 13.8 vdc version of the 6 way port charger which has a standard DC input. We have a kit that allows car, solar, generator, and external battery to charge 6 radios at once. Great for the campsite.

It isn't stock. It is a base that takes 5V DC and steps it up to whatever the charging circuit in this base requires.

So as shown... it takes 12V from a car accessory socket and drops it down to 5V so you can plug in a USB cable and then steps it back up to something like 10V to charge the battery.

From: R Pryor MAEd CETsr
Topic: 54035 Message: 54035

Looks like the Uv5R is officially now a bubblepack radio just like the cheap GMRS bubblepacks.

I wonder how many will get licensed or buy these for their kids?

http://www.bestbuy.com/site/searchpage.jsp?st=Baofeng+radios&_dyncharset=UTF-8&_dynSessConf&id=pcat17071&type=page&sc=Global&cp=1&nrp&sp&qp&list=n&iht=y&usc=All+Categories&ks=960&keys=keys

Xaun was correct at his prediction these would become a bubblepack radio in the future.

Next at Wal-Mart?

I am sure this group will have an increased Post Black Friday tech support questions. I predict these will be the NEW illegal GMRS/FRS standard.

Ok now THAT makes sense a voltage doubler base.

Any idea on the ma output?

5 vdc doubled @ 10vdc I wonder what current rating they are claiming?

100 ma rated Car Socket to USB per picture

Anyone have experience with the full recharge time?

I guess you could dump the orange usb socket and run a dual port 1 and 2.1 A socket

The ATTRIB or DIR commands both can be used with the appropriate switches and redirection.

And, yes, you are right that you can't use either of them directly "from a file browser window" in the sense that they are not usable from the GUI but rather that the bypass the GUI entirely. To use either of them you have to be willing to let go of the mouse and use the keyboard (Blasphemy!!)

Unless you perform a specific task repetitively, it is probably best to start with CMD to open a Command window before working with either command so that you can see the output before redirecting the output. Personally I usually redirect the output to a text file rather than trying to redirect to a printer. That gives me a lot more freedom both in format and letting me choose any printer on my network.

Redirecting the ATTRIB and DIR commands to text files can be useful for a lot of tasks that Windows makes either impossible or difficult (such as mass renaming of files) but of course you have to be willing to work with the dreaded "DOS" commands and batch files.

Are you saying you can use ATTRIB from a file browser window? Not sure what ATTRIB that has to do with printing a directory as opposed do DIR. Perhaps you can educate me.

I did at least find a current method for getting an action menu on the file browser to print a directory...not for users who aren't comfortable with .bat files and such though. Doesn't do any good for his CHIRP problem but already gave him a solution for that.

How to add the Print Directory feature for folders in Windows XP, in Windows Vista, in Windows 7

How to add the Print Directory feature for folders in Windows XP, in Windows Vista, in Windows 7
Explains how to print a directory listing of the contents of a folder more easily by using the Print Directory feature.

I will bet that is exactly how the vast majority of these radios sold at BestBuy will be used. The default factory test frequency is going to sound just like FRS-1 used to sound on Christmas morning.

I also bet that BestBuy will stop carrying them very quickly -- probably by the end of January -- after they see the return rate from customers who return the radio because "it doesn't work" when the real problem is that they can't figure out how to program them.

When BestBuy throws them on their Clearance table early next year, they could be a good buy for users who actually know what they are getting.

THAT would have matched my opinion several years ago - my wife wouldn't even stay in the room if I turned on the computer -- but then I was involved in a serious car wreck and spent six months in a hospital bed in what had been our living room. I couldn't get to the room where my computer and 14.4Kbps modem were located, and this was in the days before wi-fi or even home ethernet. With a little help from another local sysop, she rigged a serial connection from my laptop to my main computer so I could manage my BBS, but there were still quite a few things that had to be done directly at the keyboard. Surprisingly enough we both survived my trying to tell her how to run DOS commands without my being able to see what was on the screen.

I also lowered the charge voltage to around 8.2 volts charge termination. The battery does not get full, but will last twice as long before you need a new one, and has around 80% charge as a result.

Regards and 73,

Stan, G4EGH

I think you're right about the factory freq. Like the CB
craze when everyone was on 14, cause that's the
default crystals.

When I was in high school, someone asked me to help
with a couple CB. They had ch 14, and one set had a
battery in backwards. Oops.

So I actually use two of these chargers for scouting events. I have a 10 Ah solar battery bank that has two USB sockets out of it. I plug these chargers into the bank, and rotate out extended batteries. It takes about 9 hours to charge an extended battery, but when the battery last a good 24 hours with constant usage, it's a good trade off.

There's a TYT car charger...

Amazon.com : TYT Car Charger Battery Eliminator For TYT Two Way Radio TH-F8 TH-UVF9 : GPS & Navigation http://www.amazon.com/TYT-Charger-Battery-Eliminator-TH-UVF9/dp/B017U858VU/ref=sr_1_2?ie=UTF8&qid=1448047361&sr=8-2&keywords=tyt+car+charger

Preview by Yahoo

that I'm retrofitting to take out the cigarette plug and replace it with some power poles, and use it for a couple of different radios. I've had some GREAT success with charging different types of batteries (Sain Sonic RST599, Baofeng UV5R extended batteries, and the Anytone 8R series), and really like the flexibility.

But that base with a solar battery thingy works well. The key is to have a spare battery and swap em back and forth.

You are buying from the Best Buy "Marketplace", not Best Buy. Sears, Wallmart, Newegg and many others do this. Not much different than buying something from eBay.

If the specs are as stated (and I have no reason to doubt them), this will charge the Extended Batteries that have the socket on the side and TYT regular batteries that have the socket on the side, but I don't think it will work to charge the regular BaoFeng batteries (without the socket on the side).

This includes the voltage limiting circuitry to directly charge batteries with the socket on them but its output voltage is too low to run it through the charger base to charge the regular BaoFeng batteries.

I have one. The base is modified internally.

---In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote :

I am confused by this, they are selling this exactly as pictured?

A close up shows the USB socket is indeed 5V output at 100 ma.

I should provide a 10vdc output at 500 ma.

The base looks stock with a changed cord,

Unless you put something in between like a voltage inverter and standard charger, or one of the proper 12v chargers for Baofeng radios.such as http://www.radioddity.com/us/radio-accessories/charger-adapter/baofeng/ro-1-usb-adapter-charger-with-car-cigarette-lighter-for-baofeng-uv-5r-uv-5ra-uv-5re-uv-5r.html http://www.radioddity.com/us/radio-accessories/charger-adapter/baofeng/ro-1-usb-adapter-charger-with-car-cigarette-lighter-for-baofeng-uv-5r-uv-5ra-uv-5re-uv-5r.html

It's not as clean as a straight connection, but that will not work anywyay.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

The input to the charging base is 10 volts. The output of the power bank is 12-16 volts. The two devices should never be connected together.

When it states on the right side of the page that “FREE pick up, Not available”, that’s an indicator that it is being sold by a Wal-Mart advertiser, and not a warehouse item.

You are correct, they also have a AC/DC wall charger that will charge the side socket batteries.

One thing though, I do think the TYT stock batteries have additional power steering components built in them. While the extended uv5 batteries are straight to the battery cells.

If you unplug the charger from the TYT batteries you do not see an LED display which indicates at least some type of diode to prevent reverse drainage. However, on the uv5R batteries the LED will stay on due to the direct connection and drain.

No idea exactly what is built inside the stock TYT batteries but I would STILL monitor the use of this type of charger with the uv5 li-ion batteries to prevent some type of overcharge or heat issue. The AC/DC version though has a good Li-ion charge sense circuitry built inside them.

Radio use to program through Chirp but now I get the message "radio did not respond". My other UV-5r's of same vintage work well with the program. I have tried reinserting the plug several times with no help. The radio itself works fine with its current programming. Any ideas of why this radio will not program through Chirp? All help appreciated. Save me from sleepless nights.

Jim, AF6EC

Jim,

Since your programming cable works with your other radios, this has something to do with the connection of of the 2-pin plug to that radio. Either the 2-pin plug is not making a good connection in the socket or the socket of the radio has a problem. To see what I mean, remove the plug from the radio and attempt a download. You will get the same "radio did not respond" error.

You might try pressing on the plug while you are attempting to download from the radio. I would also recommend looking at the "Common and Error Messages" for "Radio did Not Respond" to see if any of the recommended solutions are helpful.

A new observation., on my baofeng uv5RC

while on frequency mode it showed 000.000 for both A and B, under channel mode it shows 136.025 and 470.625 respectively.
i tested the Tx behavior on UHF and it is sending signal as I watched on rtl sdr
while I could not get any signal on 136.025MHz, as it was shifting to 000.000 on TX button press.

I read somewhere that it can only program channel based programming and few others.
but not entire program what could help setting the frequencies on frequency mode.

i propose to use FT232rl based usb to com port interface.
it enables all the related wires of the 9 pin com port, not just Tx, RX alone.

OK,
Thanks Jim.
I get your message.
i had ordered for the cable on ebay.com.
could i use the conventional comport cable and still be able to read the contents?
otherwise i need to wait as it takes 25 to 40days

The problem is exactly what Jim has mentioned in his posting, I had this happen to me before and it was corrected using the method Jim mentioned. Miklor has info on how to do a restore procedure.

You will need to follow the Miklor procedure and insure you match the exact firmware file versions for the restore.

If either of you had bothered to read the original post, it would have been obvious that she tried to see if the radio would transmit AT ALL, and was using the ONLY frequency that the radio would display.

I had the same issue.. turned out, I needed to keep pressure on the plug going into the rig.. (obviously, there is some mechanical issue).. but I was then able to read the HT (download from the UV-5R)… make changes in CHIRP, and then upload those changes into the rig.

Scott

I think he was asking for a P rivate M essage also considered a OFF
list message or a email not sent to ALL members on this list.

if i was sending a message to John that's how I would have asked for
it as a PM contact.

fred

Make sure your cable driver did not get updated. Fake Prolific cables need 3.2.0.0.

Sorry, Bob, but the UV-5RC is 100% legal on 000.000 without any license.

Was the volume turned up on radio? If to low the puter might not hear it respond. Just a thought.

I'm not sure which license covers 000.000, what meter
band does that cover? Might be a low power
unlicensed band.

Hmmmm.... let's see... 000.000MHz... Oh yea, RIGHT! I do remember hearing about it...

That's the Infinity Band. Ya gott'a get a license from the Vatican to use it.

Problem is, there's only one entity who will answer your calls.

Y'know, maybe's not such a bad thing after all.

CQ Creator, CQ Creator... is anyone out there??? I could use some help here!

Stan

Every time you go to program your radio with CHIRP, check for a newer version, it only takes a few minutes and it is even recommended on the GHIRP site and on Meklers at the bottom of every post here. Save yourself time and just assume a new version may be out...

From: Jim Unroe
Topic: 54071 Message: 54108

Actually this is what the miklor website has to say about it...

How often should I update CHIRP?
New CHIRP users should always start with the latest CHIRP daily build
available. Once you have a version of CHIRP working for your radio,
you do not need to keep updating to the Latest Daily Build.

You only need to upgrade to the latest daily build when...
1. a newer version fixes a bug that affects you
2. a newer version adds a feature that you want
3. you get a new radio that requires a new build for support
4. you plan on trying to share CHIRP Radio Images (*.img) between radios.

I used to do that but I kept running into new (or old re-incarnated) bugs, so I stay with the old adage of "if it ain't broke don't fix it." Unless of course a new release has a needed feature, then install the next one.

OK back to the original post. Why would you try to transmit on a frequency that you are not authorize to use. If you need to test a radio at least try to stay in band when you test, and identify with your calls. The fact that the radio did not put out a signal does not change the fact tat you attempted to transmit out of band for a test.

I do not think they were using that freq as a xmt freq. Their radio went into a reset mode where it wrote the low and high limits into two channels and placing 000.000 into the VFO mode. Per OP.

I have had this happen to me before with various odd behavior. I just would reprogram it again. However, in this person's case it would not reprogram (read) so a recovery procedure would be needed.

OK, Larry, "back to the original post" -- but this time try actually READING the post.

And, by the way, what is the basis for your assumption that checking to see if the radio would transmit necessarily involved any action that would have been a violation of any of the rules of any radio service. I would have thought that someone who claims to have been licensed for nearly fifty years might have heard of such strange equipment as a dummy load.

The problem with "if it ain't broke don't fix it" is that Baofeng doesn't pay any attention to that when they constantly change firmware releases, so sometimes the Chirp user has to upgrade, especially if he/she has a couple of radios with different firmware levels.

Actually THAT issue was fixed daily builds long (like about a year) ago, so why not stay with a daily build a month or two old which still supports firmware mismatch protection...

As I said, "Unless of course a new release has a needed feature." I would call firmware mismatch protection a "needed feature."

I wish that they would release better documentation on what changes and features each version has instead of the user base stumbling across something different after the fact.

But hey for $30 do not expect much customer service or support.

Could this be something to do with the band limits being broken in some way? Like the MAX frequency set to 000.000?

I think CHIRP can fix that if need be?

Just a guess, I am not that sure, because I have not messed with that area of my radios.

It is some type of memory corruption issue and Chirp fixes it with a rewrite, the problem is if the Chirp program is outdated or cross loading of non matching .img files happened.then you need to do the restore procedure listed on Miklor. This involves more steps to clear this issue.

I have gone through the memory spots in browser and looked at unknown blocks to make sense of what is going on including comparing files with a hex editor. The easiest way is to follow Jim’s advice and the Miklor recovery method.

I get these bricked radios from customers that want to change programming between different versions and either did not install chirp correctly or follow instructions correctly. So I do the restore for them and insure they update properly. A few customers had problem with Chirp install which did not install correctly most likely from crappy AV software.

When they would run Chirp some of the tabs are removed from the GUI. If this happens to users installing Chirp, temp shutoff your AV program during install.

In addition, some discounted radios must have had defective chips on them and strange faults would show up on them so multiple writes were needed. The faults would rotate around after each write to something different.

All kinds of strange things I have seen, defaulting to 136 mhz is a common error for the channel 000 fault. Some radios I had to skip channel 000 and not put any useful channel memory in this spot as it would reset on its own to 136 each time.

I get any email every time there is a new daily build released that tells exactly what is new and/or has been changed. You can also go to the CHIRP repository and see what has change at any time. I visit there often in order to research the correct answer to an asked question.

Yeah... I realized that as soon as I clicked the "send" button.

Baofeng hid the "real" firmware version with the release of BFB299 firmware. The UV-5R and variants have continued to masquerade as having BFB297 in the 3-key + power-on message ever since. Baofeng doesn't want us to know that the firmware has changed, let alone give use a detailed list of what has changed.

Subject: this ht for aprs?
any thoughts on using this radio for APRS and building all pieces in one box...?? anyone experience putting a tiny tracker and a UV5r in the same box... is there interference between the two?

This question never made it to the group. I have finished making the HT and a tiny tracker all in one box with mag mounts to use on Sag wagons.. I built it with lots of toroids in a pretty small box, good size HT ant on top... works great.... the big HT battery, 9V on the APRS device.... It lasted all day...
pretty cool....

A common issue with the Baofeng Brand mics. The Wouxun brand mics at about $10 are a good deal and sound great.

Best results on the Baofeng mics I have found is to side talk them. Hold mic a few inches in front and of and to the side of your mouth a bit and point it across your breath. If you are a righty you would hold it a few inches in front of your right cheek pointing to your left instead of directly at your mount. This gives the clearest audio possible out of these mics that I have found.

Hi Paul

Sounds great, we are always looking for APRS for SAG (Supply and Gear) vehicles when we have the San Francisco Marathon, or Bay to Breakers run.

Could you post a list of parts, a step by step building manual, or do you want to build it yourself and sell it to others?

Thanks for your efforts and 73

People have been using the Baofeng and its cousins for APRS since at least 2012. A quick google search had 68,000 hits. It is a lot easier now with many using APRSdroid on a smartphone and a cheap cable(might be a way to recycle those Baofeng speaker/mikes). Others have special APRS boxes but it now seems like overkill for occasional use when you can just do it with a cheap phone and cable. You old smartphone still can work as a tablet if you switch it to airplane mode or remove the SIM card.

I tend to side-talk anyway, an old radio habit to minimize "Popping Ps" and proximity effects. So, both side-talking and backing off a foot or so didn't improve TX audio much. Couple of hamfest swaps coming up around here, will look around for a Wouxun mike. Thanks. Chuck WV8A

Subject: [baofeng_uv5r] Re: APRS

People have been using the Baofeng and its cousins for APRS since at least 2012. A quick google search had 68,000 hits. It is a lot easier now with many using APRSdroid on a smartphone and a cheap cable(might be a way to recycle those Baofeng speaker/mikes). Others have special APRS boxes but it now seems like overkill for occasional use when you can just do it with a cheap phone and cable. You old smartphone still can work as a tablet if you switch it to airplane mode or remove the SIM card.

I tend to side-talk anyway, an old radio habit to minimize "Popping Ps" and proximity effects. So, both side-talking and backing off a foot or so didn't improve TX audio much. Couple of hamfest swaps coming up around here, will look around for a Wouxun mike. Thanks.

Chuck WV8A

---In baofeng_uv5r@yahoogroups.com, <cprendon@...> wrote :

A common issue with the Baofeng Brand mics. The Wouxun brand mics at about $10 are a good deal and sound great.

Best results on the Baofeng mics I have found is to side talk them. Hold mic a few inches in front and of and to the side of your mouth a bit and point it across your breath. If you are a righty you would hold it a few inches in front of your right cheek pointing to your left instead of directly at your mount. This gives the clearest audio possible out of these mics that I have found.

54145. Problems with Chirp

Tying to program some radios for a local Fire Dept. Downloaded chirp, and the provided driver with the programming cable. Attempt to read radio and it doesn't give me an option to chose which comm port. It says under control panel that the driver device cannot start. Code 10. Idk what to do. I'm running windows 8 and recently did a download to upgrade to windows 10. Idk if that has anything to do with it or not

54149. Cannot D/L freq into radio

I hope I have written to the right group. I have just bought the Baofeng/Mistuba model 'Samurai' Dual band HH.
I have downloaded and filled out all the frequencies I would like installed but the radio says' unable to download and install'.
I notice it says com 1, but they are all greyed out so I cannot try another port. This could be the problem, what do you think.
I am using W10.(but the little disk only goes to W7)
I would be very grateful for any help as I'd love to make a contact.
Regards to you all.

Hi Jim,

Very common problem. Go to http://www.miklor.com http://www.mikor.com
and get the prolific driver 3.2.0.0. It is an old version, and you do NOT want a later one.

GO OFFLINE and install the driver. I am not sure how you tell Win10 NOT to update a particular driver, but that is what you need to do.

Then you can go back online if you wish, and you should be OK.

Problem stems from a bootleg chip that is not made by Prolific, but uses their driver. Prolific got the hump and wrote a modern driver that screws the bootleg chip.

Elegant, but expensive, use an FTDI chipped cable...

HTH,

Being the OP of this item, i have to say that no exploration of any kind was tried by me.
It failed, supposedly, due to a battery discharge while in use.
No way, I had made any attempt to over tune , cross the designed limits etc.
I could progress only after receipt of the programming cable, that I ordered from e-bay.

I shall indicate the developments.

Hi Jim,

Forgot to add, after you did that, ALWAYS plug the cable into the same USB port, otherwise Windoze sees a new device, and downloads the driver for it, overwriting the 3.2.0.0. one you wish to keep...

Look forward to a ragchew sometime :-)

Kia Ora Stan.

Well, that's very nice of you to take the time to explain this to me. I never knew this, so I'm extremely grateful.

Since the last time we exchanged mail, I ended up in Hospital. It came as a shock as when I woke I couldn't stand up, the room was spinning violently. I made it to the Doctor's surgery and they thought I was having a stoke so called an ambulance to the surgery. To cut a long story short they found I was suffering BPPV (a type of vertigo), once that was established they corrected the problem quickly.

So it's been quite a few days. All I was worried about was dying before I'd tried my new radio out hi hi.

Thanks again Stan, you are the perfect gentleman.

Jim.

From: murrayhely@...
Topic: 54157 Message: 54157

When the UV-5A is set to scan it will find a channel with a signal on it . It then stops for a few seconds and then moves on even if the signal is still there.
Most scanners stop on the channel until the signal disappears and then it moves on ! Can the UV-5A be programmed this way ?
Can this be done ? Thanks Murray ZL3MH

Good Grief, I am sorry to hear that Jim.

Hopefully, both yourself, and the radio programming are now going as intended.

It is a great little radio when used as intended, and I have had countless hours of fun with mine. It has been very popular in the local club, and done a lot for keeping members in touch.

It also has the worst performing receiver I ever used, when I put it on a big antenna outside. That's a no-no... Although three, quarter wave stubs on the feedline sorts out any issues, and allows it to work a lot better, unless another local comes up on the same band...

Best of all, it is very cheap, and I am not afraid to carry it around all over, getting a lot of fun from it. I have a 25 year old dual band, very expensive at the time, and because I was afraid to take it around, it is mint... Which is the best radio? :-)

Keep well,

> KI6BL

The radio has no driver. It is the USB programming cable the needs a
driver. It if has a Prolific type chip, then you need to get one of
the generic drivers or purchase the 3rd party driver. The Prolific
driver is usually incompatible.

Hi Thomas,
What version of Mac OSX?
When you launch CHIRP, does it bounce a few times in the dock but then fail to complete launching?
I hear that you downloaded the Java runtime, and forgive me for asking - did you run the Java runtime installer? & did it install ok?

What, exactly happens when you double-click the CHIRP app?
I can't see what you see, so please describe, What do you see?

Hi Bruce,

No... It is a Standard C500 dual band. As a precaution, I replaced a certain electrolytic that is known to fail, and take out a "hard to get" chip. And it works very well. Fortunately, I got a CTCSS board for it at the time.

Regards and 73,

Stan.

Topic: 54161 Message: 54172

I have heard on some other groups that various applications refuse to properly run with El Capitan. It could be related to needing new (different) drivers for the USB port. If you can still run CHIRP with the MBP, give that a try. I've had good luck with an older Mac Book that runs Yosemite 10.10.5 and an FTDI based cable. Even then, I have to firmly hold the rig end of the cable into the UV-5R.

I bought a Baofeng UV-5R HP 7 Watt radio from Main Trading Company out of Paris Texas and after looking it over I noticed the sticker with the FCC ID # was over another sticker under neath. I peeled up the sticker to see the one under it and it had a model # of UV-5R with a freq range of 136-174/400-480. The UV-5R HP sticker freq range says 136-174/400-520. I have ideas why the sticker was placed over the other one but it's just my guesses.

The basic electronics is the same.They all do thewider range if you open it with CHIRP. The higherpower mostly just kills your battery faster.

It actually has a usable freq range of around 132-177 in VHF right out of the box. I have yet to program it because I had upgraded to Windows 10 on my PC and my cable even after putting in the older driver just doesn't work. I need a genuine FTDI cable.

BS! you need to allow W10 to install unsigned drivers.Then you can install 3.2.0.0 and be back in business. ==

Have been running CHIRP latest daily builds and many previous on MB Pro, OS X 10.11.1 and previously on 10.9. No issues. CHIRP will launch whether or not anything is plugged into the USB port. I do this to open and edit saved configurations before plugging in the radio and uploading to it. You do not need Java runtime for anything. You do, however, need to run the KK7DS Python runtime on the new machine before attempting to run CHIRP. If you haven't already done this, link to it is at the CHIRP site, under the "Mac OS Users" paragraph. http://chirp.danplanet.com/projects/chirp/wiki/Download

Once this is done, because of security protections, you may be prompted that CHIRP can't be opened. Instead of double-clicking to launch the app, select the program wherever you have it (Applications folder, etc) in Finder, then control-click or right-click and OPEN from the contextual menu. After that a regular double-click will launch it normally.
I've found the Prolific chipset cables to be troublesome. Replacing with an FTDI chipset unit cleared that up. The FTDI drivers are baked in to the OS.

For what it is worth, this email larry.rj73@... may be associated with scamming.See http://www.eham.net/classifieds/detail/485490 which states that the actual owner is not selling either radio, and their accounts have been hacked. A simple question to ask yourself is why is this email address when the "seller" is named Alan Zaur? A quick search will show "Larry" associated with selling lots of equipment on lots of boards, many of which do not apply to the equipment he is trying to sell.

Got Chirp to open and it shows my old radio channels, etc.

Plug in the USB cable that I used on the old computer (so I know it works) and it is pushed in well. Go to download from the radio, set it to Baofeng & UV5R and then each of the connection settings and none work. The best error message I got was that the radio is not responding. Checked the cord to make sure it was all of the way inserted… Even tried a different USB slot.

Thomas,

Now that you've gotten Chirp to load, the next thing to check is to make sure that Chirp is recognizing the USB cable:
1. In Chirp, go to Radio-Download From Radio
2. In the dialog box, the "Port" should indicate "/dev/cu.usbserial-xxxxxxx" (on my computer, the default says "/dev/cu.bluetooth-incoming-port", so I always have to use the drop down arrow to change it to the USB port).
3. If the "/dev/cu.usbserial-xxxxxxx" doesn't show in the drop down list, then the device driver is not installed properly or the driver is not the right one for the cable.

Here is a link to more information on using Chirp with MacOSX:

Hi Tom:

In my case (although I am not using El Capitan..) I had to physically press on the plug that connects to the rig in order to get a proper connection. But, in doing that, I was able to download and upload just fine. This was with an FTDI cable.
Don’t forget to tell the OS to look for a serial connection on that USB port.

How do I do that on a MAC?? As for the plug, I did do that and no connection. The cord worked well on both of our radio on the MacBook Pro..

Frank,

The list of issues that are "possible" with Windows 10 (or any other operating system for that matter) is completely dependent upon your computer skills and knowledge. Some folks are easily able to run Windows based software (like Chirp) in a virtual Windows environment running VMware under Mac OS, yet others have extreme difficulty understanding how to install a USB cable driver correctly running under Windows 7 by itself.

In general, "if" you install the USB cable driver correctly, you won't (normally) have an issue with Chirp. Getting Chirp to work the way you think it "should" may require some additional effort on your part.

Never have FTDI issues. Totally plug and .play. The *prolific* drivers are the ones with issues.

I have W10, Threshold 2. The only issue is I have to roll back the FTDI driver in order to open a com port. It works with VIS and CHIRP. If you have issues: http://tomcatt.webs.com
 I can remote in to assist you. From: baofeng_uv5r@yahoogroups.com

I suppose I should clarify my rationality for bringing up the
windows 10 64 bit chirp issue. I have read on the internet that window 64 bit does
not function with chirp, but this is at least partially incorrect for chirp did work
initially
along with windows 64 bit until just recently seems to have failed. The failure
issues is this: When I upload an image to the uv5r and then upload it back to
the transceiver it returns back with different settings that I did not type on to
the spread sheet initially. I am thinking more towards a partial failure of the
microprocessor within the Uv5r but how does one prove out such complications?
PS in the meantime I bought
a new radio!

I have two USB ports on the front of my Windows 7 64-bit computer. So after I selected the 3.2.0.0 driver on the left USB port, I then switchrf to the right USB port causing the driver search. Once it failed (as expected) I promptly selected the 3.2.0.0 driver and forced it to the same COM port that was assigned to the left USB port.

This allows me to plug into and use either USB port.

54201. 2m band antenna

Yahoo group: baofeng_uv5r (2015)

Hello, we pretty much ONLY listen to frequencies in the 2m band. Can someone give me some advice on a 2m-band-specific antenna that would really pick up these frequencies, yet still allow us to stay portable?

Thanks.

I am the communications director for a local group that sends up a Ham radio operator and medical
people into a Forrest Service wilderness area that is very popular. Comm is exclusively on 2 meters
and nothing is a direct path. Cell phone coverage is spotty at best.
We have tried everything and have settled on the 1/2 Wave Smiley antenna. I call it my pocket linear!!

http://www.smileyantenna.com/product-p/14686.htm
http://www.smileyantenna.com/product-p/14686.htm

Another good product is one of the 18 inch whip antenna made by a number of manufacturers from Chinese to domestic. If you want to support a USA manufacturer this outfit makes them from titanium wire.

If you want an antenna fixed to the radio give the Nagoya NA771 a try. I have been using one on my quad for 2 years. Works great and tough as nails. Just make sure you get an authentic Nagoya. If you want even better performance try buying or building a roll-up Slim Jim antenna. I built my own but there are lots of vendors on eBay and elsewhere. I just tie a weighted string to the top and throw the weight over a tree branch as high as I can get.

You will learn a lot more by taking a class. Most, if not all, radio clubs offer them for free. Well worth it. You can memorize the answers, but it is much better to know what it means. Check ARRL.org for info on nearby radio clubs.

Thanks for the quick reply.

Two other things I've been wondering about. It seems there is a certain protocol or way of speaking to other ham operators. Is there some kind of "cheat sheet" or booklet, etc. that explains this.

Secondly, on another topic. I've been reading good things about the UV-82 and thinking of picking one up. Any thoughts.

Thanks, too, to the posts on antennas.....

Ham License good for ten years. Shortly before it expires, send in a form that asks the FCC to renew it and they say 'ok'.

Go to http://www.repeater-builder.com/humor/how-to-sound-like-a-lid.html.

NOTE: Sounding like a LID is a BAD thing. Remember, you are NEVER required to use the other persons call sign, with one exception. They have to use theirs, you have to use yours. Every 10 minutes and at the end of your conversation. Do not use 'Q' codes. Those are for CW (Morse Code, and HF) not for 2m/440 use. Use plain English please.

Topic: 54206 Message: 54217

$40?!?! You should report that VEC to the FCC.The current charge is $15. I'm a VE for theLaurel VEC group and we don't charge for tests.
Maybe there is a Laurel group in your area:
http://larcmd.org/vec/

BTW, vanity is free now.

From: "petebracey@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

The local group where I live charges 40 dollars I have had my licence previously and was looking to retest and hopefully get a vanity to get my old callsign back from 1992

The UV-82 has a bigger speaker that sounds better than the UV-5R, bigger keys, numeric keypad laid out correctly, and two PTT switches. Otherwise the guts are the same radio with the same (in some cases piss poor) performance.

Any anecdotal reviews on that antenna by SignalStuff - https://signalstuff.com/

That is looking liking something I'd want, but wonder how it compares to the Nagoya 771 which everyone seems to like. Wish there was a video review somewhere.

ALWAYS use simple plain english. No need to use Q codes, or any other "radio joe" talk. I never use "Roger", I just say "uh-huh" or "ok"

NEVER say your call sign and "for ID" It is redundant. Once you say your call sign, everyone knows you have said your call.

In my opinion, the UV82 series is the best of the Baofengs. The UVb5 has terrible intermod issues and the uv5r isn't far behind... while the 82 has its intermod issues, it isn't as bad.. again, what i experienced.

Our local club does not charge for classes, but they will sell you a manual at a discount. $15.00 for testing, and if successful, you can take the next tests until you either fail or pass them all. Retests are also $15.00. Www.w7aia.org.

According to the schematics on the FCC web site it's basically the same
thing.

>Its performance IS less sucky that the uv5r.
Some people have no problems with them. In my experience the receiver is
just as bad as the UV-5R at my location but I'm within 1.5 miles of all
the TV and FM stations and most of the big commercial 2-way towers.

Agreed - use what works best for you.

What I found worked best for me was to study the book then take free practice exams online until I passed them regularly with 85-95% scores. I passed both my technician and general tests missing 1 question on the tech and 2 on the general.

I'm continuing this plan working on the extra class now, and expect that it will work just as well.

Good luck with it!

Matt

I have them on my QYT go box portables and they work well and can take a beating at the base. The bases are slightly flexible unlike other models that offer no flex capabilities in the collapse mode.

I upgraded all port boxes to this antenna. No regrets either.

I am the communications director for a local group that sends up a Ham radio operator and medical
people into a Forrest Service wilderness area that is very popular. Comm is exclusively on 2 meters
and nothing is a direct path. Cell phone coverage is spotty at best.
We have tried everything and have settled on the 1/2 Wave Smiley antenna. I call it my pocket linear!!

http://www.smileyantenna.com/product-p/14686.htm

Another good product is one of the 18 inch whip antenna made by a number of manufacturers from Chinese to domestic. If you want to support a USA manufacturer this outfit makes them from titanium wire.

The typical extended battery will not fit the UV-5RA out of the box.
If you plan on getting one, you will have to whittle on the radio
and/or battery to get it to fit or look for the an extended battery
that is designed for the UV-5RA (thery are very rare).

Each area is going to be different. It can ever vary from repeater to repeater. Your best bet would be to listen to the conversations in your area and learn from what you hear.

... unless you want everyone to know that you're just trying to keep things legal, and that don't expect or want any kind of response.

For example, if you're checked into a directed net and you just announce your call sign, net control will assume that you're trying to reach him/her, possibly wasting scarce time and bandwidth in the process of responding to your call (depending upon the purpose of the net). If you add the "for ID", net control will know that you messed up and forgot it the last time you keyed up, and just ignore you.

Regarding this particular question, I'd also add to take with a large dose of salt any advice given to you by former CB'ers that only recently got their Tech, General or Extra class licenses, say within the last 4-5 years.

You'll hear them on the air (and read their communication "advice" on various forums, including this one) on a large variety of topics, many of which they are completely unqualified to make. (I heard one at the Albq NM hamfest last year that said a longer antenna will ALWAYS outperform a shorter one, regardless of impedance, SWR, etc. Bob Heil of Heil Sound fame [who was at our booth] tried to explain to the new Tech and his unlicensed friend why his premise was false for 10 minutes, all to no avail.)

Of course, you'll also (occasionally) have a new license holder that truly understands the topic being discussed and their advice is valid, the trick is knowing when to take that advice. In general, just realize that any fool can make and post an internet video or email posting, so just finding something posted on the web does NOT mean it's 100% factual. It's mostly their opinion, which they are entitled to, but that doesn't make it correct.

$40?!?! You should report that VEC to the FCC.
The current charge is $15. I'm a VE for the
Laurel VEC group and we don't charge for tests.

Maybe there is a Laurel group in your area:

http://larcmd.org/vec/

BTW, vanity is free now.

From: "petebracey@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

The local group where I live charges 40 dollars I have had my licence previously and was looking to retest and hopefully get a vanity to get my old callsign back from 1992

It depends.

Some people need the extra help of classes, some don't

You didn't say which book. There are two main choices that I am aware of
... the ARRL and Gordon West.

Each will work (for some) ... the ARRL book is harder but it teaches you
what you need to know. The Gordon West book is easier, but it only lets
you learn the answers to the questions. There is some background data on
the questions, but minimal.

I am not an electronic professional, but have been interested in it (and
radio) for years. I used the Gordon West books for both my Tech and General.

I can understand why you would think that way, Christopher, but in general anyone with years of experience in a technical hobby or profession normally has learned along the way what works and what doesn't.

That's not to say anyone's perfect, far from it, but given the current level of technical skills or knowledge required to pass an FCC test today (vs. not too many years ago), a Novice class license (back then) had to know more than a General class today.

In many areas of the country (your area in Farmington, NY may be different), 2m and 70cm resemble FM CB, certainly not amateur radio as most of us know it. The lack of knowledge that would have embarrassed new hams 10-15 years ago is commonplace today.

Many licensed hams today have no idea of even the simplest procedures (setting PL tones, offsets, etc.) and think it's perfectly acceptable to show their lack of the most basic technical skills every chance they get.

The FCC (and the manufacturer's) got what they wanted when they made the various tests basically an open book exam several years ago. Back then the term "appliance operator" was a slur meant to indicate a ham that had no (or next to none) technical abilities and had to buy everything. Now, not only do the appliance operator's buy everything radio or antenna oriented, they want someone else to program their new toys or build their antennas for them.

I've met some experienced amateur radio people who
have earned my respect, and a couple who have not. In
the fire service, there is an expression. You can have
twenty years experience, or you can have one year's
experience twenty times.

BTW, I'm reasonably sure I've not given out my call sign
or location on this list. Any speculation is, well, just that.

I'm going with KD2INH, Christopher A. Young in Farmington, NY, a freshly minted Technician from April of this year. That's just a guess, but one I feel pretty good about.

Why would you not give your call sign then be rude enough to brag about it?

It's considered general decorum to sign your postings on any HAM related reflectors/email lists/newsgroups with your name and call.

Happy holidays (whichever one suits you in particular this holiday season)

Matt King

I have chosen not to give out my call sign or
location on this list. Any speculation is....
speculation.

When have I ever "bragged about it"? Heck, I
hardly ever mention or hint if I'm licensed at all.

Maybe I'm not big on general decorum. It's my
choice, and the moderators have said that's OK.

If you made a decision (of some sort or other) on
the list. Choose any one of several possible examples.
Would you appreciate others on the list to do just the
opposite of what you chose?

Is that common in the ham community? The level of
direspect for my choice is rapidly increasing. Two people
tonight have disrespected my choice, within about an
hour.

First the old seasoned operators who think they are
perfect, and then the disrespectful ones. This isn't
encouraging me to involved in the ham hobby.

Yes the Morse code requirement was eliminated February 23, 2007.
Yes years ago.... You needed to know the names of the exams you were taking.

Take the test, Enjoy the hobby.
You will make new friends and you will find the Ham community is very supportive.

It is a great hobby.
My first contact was to Malta using an old Kenwood TS-140. A huge thrill.

I read the ARRL book, and did HamtestsOnline. I passed from tech to General. I use the ARRL book as a reference - it's very good.

seems that some do not know the difference between 'expert' and extra class license in ham radio.

Probably does not matter since most that memorize the answers will not think much of ham radio when they cant figure out how to program their $25.00 radio..

One of the main objectives of ham radio is public service, what better way of being in the public than belonging to a ham radio club. Meet many people with similar interest and lots of free help. And the classes that they teach are well worth the time and money.

bobbie

kd4lv extra class -- not expert class

A simple PO box will keep your exact location personal.
You could even use a friend's house. You only need tobe able to get your mail, if any, from the FCC.

Isn't multiple disregard of a person's choice
considered to be an abusive asshole?

"NO MEANS NO!"

This list needs sensetivity training. I mean,
if you did this to a woman at a bar, you'd
be arrested and prosecuted.

From: R Pryor MAEd CETsr
Topic: 54206 Message: 54280

They should offer a code endorsement or something to get others interested in CW. However, if they put code back into the tech exam, I bet you the ranks of licensed Hams would go down with a large surge in unlicensed users especially for the inexpensive Chinese radios.

$40?!?! You should report that VEC to the FCC.
The current charge is $15. I'm a VE for the
Laurel VEC group and we don't charge for tests.

Maybe there is a Laurel group in your area:

http://larcmd.org/vec/

BTW, vanity is free now.

From: "petebracey@gmail.com [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

The local group where I live charges 40 dollars I have had my licence previously and was looking to retest and hopefully get a vanity to get my old callsign back from 1992

I'm all for adding a code test to the General and Extra exams -- but not for CW. Computer programming is a far more important skill for the ham than Morse code in this century. Write some DSP code and I'll be impressed. :-)

"Christopher A. Young",

My initial impression is that you are basically a pompous ass.

Ham radio is a community. If you don't wish to be a part of this community then please feel free to "exit - stage right" and be done with it.

I don't find any of your postings the least bit respectful; which is what you claim to demand from the rest of us.

You are not anywhere near as anonymous as you like to think you are.

73 and best wishes.

I like this idea!!

What sort of DSP code would you like to see? Already done some CW and PSK-31 stuff over the years.

I also remember doing CW using an old TRS-80 and the tape recorder relay in the old days.....

From: Craig Carnahan
Topic: 54210 Message: 54290

No, this coming from a guy that was simply trying to explain to Chris that his "after the fact" expectation of personal privacy on the internet (after he uses his real name, his real ISP, and continues to tell us of his various adventures in and around his local town with bike races, pumpkin watches, etc.) is *totally unrealistic*. Had I wished to disclose information about Chris, I'm sure a simple google search would provide even more info, but that was never my intent, plus it would be a waste of time (for me at least), since I really don't care (one way or another) what Chris thinks or does, or where he works, lives, etc., etc.. I'm just not one of those folks that really gives a darn about public opinion one way or another, but especially about folks that don't really know me at all (no offense meant, it's just the way I was raised).

If you look back to the original posting that started Chris's tirade, you'll notice that I never even mentioned Chris, nor was I even thinking about him when I posted a legitimate answer to a previous question from another poster, which was basically how to talk and behave on the air. I merely suggested that one should take care about where a new individual to radio takes his (or her) information or suggestions from, as many folks new to amateur radio haven't a clue of what technical information is truly valid. Chris apparently took offense to the suggestion to be careful when listening to new folks, and especially new folks that come from the CB world (and no, I didn't even comment on his suggestion for using 13 codes in a previous posting, hopefully he meant that as a joke and wasn't really serious).

In any case, I get that Chris thinks his suggestions come down from Mount Olympus and that no one should dare to question many of his assertions. You may agree with him (or not), he certainly has a right to his opinion, but then so do the rest of us.

54293. Antenna length

Yahoo group: baofeng_uv5r (2015)
Date: 2015-12-15 12:50:40 UTC
From: Christopher Young
Topic: 54210 Message: 54293

The two units I have, they came with different antenna length. Is there some reason for this?

I did get a couple longer antennas in case I was a distance from the repeater. The mobile magnet mount seems to work well in rural areas, with little EMF from stores, factories, power lines.

Does the longer (factory provided) antenna have more gain?

I've noticed that if I turn off the power / volume knob, the battery doesn't appear to go flat like nicads.

Also, the standard batteries last a long day of occasional TX for various events.

Has anyone talked a battery to exhaustion? How long did that take?

I ran a test on both batteries a while ago and came up with a chart and a formula. It depends on your volume setting and duty cycle.
You start out at about 40 hours with the radio on and doing nothing. 86 hours with the extended battery. That's with a minimum volume level.
Then, once you start transmitting and turn the volume up it drops rapidly.

54299. Charger flashing

Yahoo group: baofeng_uv5r (2015)
Date: 2015-12-15 13:38:22 UTC
From: macdroid53@...
Topic: 54299 Message: 54299

Hi,

I have two UV5R and two UV5RV+.

When I charge one of the batteries, the charger goes red (i.e. stops flashing red/green) for a while, but then starts flashing red/green. Depending on how low the battery is, the red time is different (more discharged, longer red before flashing starts).

The rest go red and when charged go green. These act the same no matter which of the four chargers I use.

The battery that goes to red/green flash after charging does the same in all four chargers.

So, it appears it's something about the particular battery pack. These are only a few days old and this one has always done this.

It also appears to charging, i.e. the battery appears to be charged after being in the charger.

Thoughts? Ideas?

Regards,
Mac

The only point of reference I can provide is that I have measured the self-discharge rate of the LiPo battery used in the Mobilinkd TNC (http://www.mobilinkd.com/) at around .05% month. I have a TNC that has only been turned on for this test for more than two years. It was still over 4.1V after starting at 4.2V when I last looked.

The Baofeng battery is very similar. Since the radio has a physical switch, it draws no power itself when turned off.

The UV-3R, which does not have a physical switch, has a much faster discharge rate. It will only go a few weeks or months. Although a much better radio than the 5R in many other respects, battery life is a weak spot for the 3R.

You can find power draw measurements of the UV-5R by searching the archives. This research was done a few years ago and published on this list.

I have no idea what level your knowledge of antenna design is, so ignore what you already know.

The best antenna for a given frequency can be calculated, the formulas are readily available. The correct length is based on the frequency (wavelength, actually) being used.

Any antenna used to cover a band of frequencies will be a compromise, since it is not tuned to a particular frequency. (and, in the case of the uv5r, two different bands)

I remember checking SWR, back in my CB radio
days. As you say, the BF-UV5R are dual band.

My guess is an inch or two isn't going to make as
much diff as resonant frequency. I've got no way to
check that, at present. Don't have SWR meter.

Most likely, doesn't make a lot of difference.

you work fractions of inches when adjusting swr on antennas. get yourself a swr meter if you want to tune an antenna. dual band antennas cant be tuned by length based on operating frequency. there are coils or loops involved.

54310. Re: [baofeng_uv5r] Testing for tech licence

Yahoo group: baofeng_uv5r (2015)
Date: 2015-12-15 15:13:29 UTC
From: Ray Sills
Topic: 54206 Message: 54310

Yes, passing a code test was a rite of passage… and one of the justifications for the test was because the military was still using morse code for communications. Having amateur radio operators who were conversant with code, provided a pool of possible operators, should the need arise.

But now, the US has an all volunteer military, and the military does not use morse. So, there is no special justification for requiring the ability to send and copy morse code, as far as the national interest is concerned.

One of the original ideas behind the creation of the Technician class license was to provide a means for amateurs who were more interested in the technical and design aspects of the hobby to have a way to operate. There were a number of engineers who were interested in amateur radio, but not interested in HF operation, especially with CW.

When I was a young ham (many decades ago), I pushed ahead to learn morse with sufficient ability to pass the FCC test (and before an FCC examiner) for 13 wpm. Why? Because you had to do that to receive a General Class license. Why did I want a General? So I could operate phone on HF. That made no sense to me… then, or now. Supposedly, the exams for Technician and General back then were identical. The only difference was the code test.

For many years, I never operated CW. Now, it’s pretty much all I use on HF… and QRP, as well. I bet there are a lot of operators who have adopted CW, now that it’s “voluntary”. :)

And, it was always the case that those who had the skill to memorize answers, or the ability to make good choices on multiple answer tests, were passing exams, but not having the underlying deep knowledge as to the “why” and “how” of electronics. I think of it as analogous to taking a driver’s test. You pass the test, but by no means are you automatically a good driver. You simply have to opportunity to learn and get experience. And, then you become a true radio amateur.

You can't really measure SWR of a portable antenna on an HT (like the UV-5R).

The SWR depends on being plugged into the radio, how you hold it, and what kind of ground plane you are for your radio.And SWR doesn't tell the whole story either. An antenna with higher SWR may well transmit better than one with lower SWR (similar to HF antennas).
Highly dependent on pattern.

What matters is how it works when in operation. Since the UV-5R doesn't have it's own SWR meter you really can't measure it.
That's why I did a remote test of signal strength. That's where the rubber meets the road....

CW was part of S.25, an ITU requirement for amateurradio operators. That requirement was dropped atWRC '03 and it took the FCC 4 years to codify it inthe Part 97 rules. That was effective in February '07.

That is also I good idea, the overlap of tech fields is really strong these days. You need to know about everything including programming. Even in here, questions about programming these radios is a popular question.

Interfacing the radios via a control device and software is something good to know for the HRO. However, this should be included in the extra or another maintenance or design style exam above Extra. If we include too much material in the basic tech license I feel the Ham community will scare people away from it.

Most younger people look at HR as outdated and old fashioned compared to their I-phones, therefore making the entry test level harder would most likely drive away new members. Of course the techies would find this an interesting challenge and like the idea.

I have a hard time getting people interested in HR even with the complete question pool and a book. Any extra work these days seems to turn away some people another complaint is the need to show up at a testing center instead of doing the exam online. We have a license and study table at our booth and these are the biggest excuses I hear from people wanting to buy a radio but are told they need the license to operate.

I suspect most just buy uv5R and operate either the test freq pattern or in freq mode. I know this because I would spend a large amount of time explaining regulations and the fact we stopped programming radios bought elsewhere for people walking in the door. I would guess 99% are unlicensed, if they are licensed I usually try to help them out.

If the exams become too hard, the result would more unlicensed. Those that live in more rural areas it is easy to ID repeater abuse. In SCali it is a mad house on some of the repeaters due to unlicensed users.

I'm all for adding a code test to the General and Extra exams -- but not for CW. Computer programming is a far more important skill for the ham than Morse code in this century. Write some DSP code and I'll be impressed. :-)

Most likely, yes.. the longer antenna would have more gain. The provided “rubber duck” antennas are usually “continuously loaded” (made with a springy metal coil). Those types of antennas are simply meant to provide a reasonable load for the transceiver. The SWR might be 2 or 3 to 1, but that’s usually within the limits of the rig’s design parameters.

Longer antennas may still have a loading element (often a coil in the base of the antenna), but the losses in the antenna will be lower than the duck, and will perform better for both receiving and transmitting.

Using a mag mount, especially on a vehicle, is a great way to improve performance. The metal surface of the vehicle acts as an excellent ground plane, and will increase efficiency as well. Indoors, you can do the same thing by putting a mag mount on top of a fridge. :) One down side of vertical antennas is that they tend to receive more “noise” from man-made and natural sources, simply because most of the noise has vertical polarity. But, the advantages of omni-directional signal pattern make to worthwhile to use vertical polarity, especially for FM operation, where much of the noise is reduced, simply because of the modulation technique. Digital voice, when and if it becomes the “norm” for VHF and UHF ham use, will also work fine with vertical polarization.

Hello "Pete"

I would go for the BF-F8 HP, http://smile.amazon.com/BaoFeng-BF-F8HP-Two-Way-136-174Mhz-400-520Mhz/dp/B00MAULSOK/ref=sr_1_1?ie=UTF8&qid=1450196051&sr=8-1&keywords=BF-F8+HP

With this battery http://smile.amazon.com/Baofeng-VB-29-3800mAh-Battery-UV-5RTP/dp/B013WPA6YO/ref=sr_1_15?ie=UTF8&qid=1450196158&sr=8-15&keywords=BF-F8%2BHP

And this antenna http://smile.amazon.com/Authentic-NA-771-15-6-Inch-SMA-Female-BaoFeng/dp/B00KC4PWQQ/ref=sr_1_7?s=electronics&ie=UTF8&qid=1450196410&sr=1-7&keywords=anytone+termn+8r

If price is no concern, oh how I wish, then consider the AnyTone Termin8R. https://anytonetech.com/purchase

I also wish to point out that Amazon has a charitable contribution program, you can pick which charity will receive some percentage of your purchase price from Amazon. My organization is AmSat so that is why you see the smile.amazon in the URL. I hope you will choose to support our hobby by supporting the organizations that support us.

I hope I gave you some starting points, come back with any questions or clarifications.

Dear Ray,
Please check your email program. This obviously
from the email list, as the [group name] is in the
subject line. Which is how we know it's a group email.

I tried to reply several times, and the email kept going
some where else.

My grand father was a ham, and the radio thing
missed a generation, and picked back up.

<off list>

Hi Christopher:

Regarding that callsign thing…. I suspect any criticism is more about being intensely proud of being a ham. It’s something quite special. In my case, there are quite a few people in the US… and maybe in the rest of the world, who share my name.
But, nobody on the planet shares my callsign. And, I doubt anyone will request it as a vanity callsign after I die.

Of course, to each his own. It does not bother me either way. However, I do note that there are some email lists or web groups devoted to some aspect of ham radio, where it’s required to include a callsign, at least of you want to post. But, that is someone else’s rules. And if you want to join in, you follow the rules.

In any event, welcome to Amateur Radio. It really is (for me at least) a fun hobby. I’m not terribly active, but enjoy it when I am. And, everything good in my life is a direct outcome of being a ham: I found my career, thanks to ham radio, and I found my wife because of ham radio (her father was a ham, and I knew him first).

Forecast for high winds tonight, with scattered power cuts.

I was out earlier today for appointment. And yes, it was windy.

Now, near to sunset. It is a bit reassuring to have my HT
and a few batteries charged up. The one LED (it is better
to light a single LED than to curse the darkness). And a
good chance to have comms after the power is out, the
wires are down, the phones are down, the cell towers
are off line.

Anyone else prepared for a power cut? And how does
your BF-5R figure in to your plans?

I have two 35 Ah batteries and will just use mydual band mobile radio at low power until thosebatteries die. Then I may go to '5R. I'm tooclose to radio towers for 2 meter use. It's fine
for the 440 repeater on the big TV tower in town.

Do not use car batteries inside. Besides having looseacid, they vent explosive hydrogen gas. Use Sealed LeadAcid batteries (SLA) and since batteries give out massiveamounts of current, you should fuse it at the terminalto prevent fires. Think lots of watts in a hurry andprepare accordingly so you don't burn up.

if one needs am outside antenna on a baofeng 2 band use a j-pole,
even the twin lead toll-up--put a relief sma to uhf connector om it
and you will have something which is safe

Well, the loose acid is contained in plastic.

And there should be no hydrogen, except when
charging.

The fuses are good idea.

Part of the project is to work on a near zero budget. Yes,
the SLA batteries ought to perform better. But that relies
on some thing called "money " which isn't easy to find.

I keep looking for more, but it doesn't grow on trees.

Has anyone else used ham radio in a power cut? Talk
to whom, and say what?

From: Phil
Topic: 54210 Message: 54333

Backup power, hmmm. . .

Let's see. I only have 3 12 Volt 120 Amp/Hr deep cycle batteries (360 Amp/Hr total) tied in parallel, in the shed adjacent to the radio room wall (about a 10 foot run of 4ga wire). It's tied to the 12 Volt (actually 13.6V) DC bus just under the operating table to which is tied ALL the radio equipment except portables and the Regenerative receiver. Also a FT-1900 2M rig, the computer DSL model and router, a 300W AC inverter (for small 120VAC needs and so forth). ALL of this is kept on float charge 24/7 via an Astron LINEAR PS (no noisy switching PS here).

Much of the radio gear is left turned on 24/7, the Astron keeps the batteries up and operates the gear. The computer is on it's own UPS system which is able to keep it up and running for maybe 30 minutes or so, at which time it gracefully shuts the 'puter down. (in an extended emergency I COULD plug the 'puter into the AC inverter. The 'puter is usually always on 24/7, tied to 2-5 DC++ sharing hubs at any given time.

There is also emergency lighting mounted right over the operating position, consisting of THREE Harbor Freight 24 LED lamps mounted to an aluminum bar, tied in series and connected to the station battery. LOTS of light for very little operating current. The LED lights are designed for 3 AAA batteries in series at 4.5 Volts, so 3 in series are ideal for a 12 Volt station battery. AND they were absolutely FREE with Harbor Freight coupons!!

Now, should we have a serious power outage, I'd turn off all radios that weren't actually in use at the time, and IF the batteries should need it, pull the Ford F150 Screw (4 door super crewcab) up to the storage shed and with a jumper cable charge it from the truck. . . It's never been needed (yet).

I also have a plethora of LED flashlights (many of them obtained free from Harbor Fright) and a 12 Volt "Jump-Start" battery that can be carried to where needed.

So, I think I'm ready for most any 'normal' power failure. Of course, should we have a massive "EMP Event" that would be another story, but then, I wouldn't be alone in that either. . .

As a side note. On a few occasions I've run the annual Field Day event "Class E", from home on emergency power. On those occasions the Astron was turned off, any unneeded radios turned off, room lights off and ran everything, including the 100W HF rig, lighting, Antenna Auto-tuner (yes, it needs 12 Volts), 2M rig AND a laptop off the station battery. It held up just fine and after the 24Hr event the Astron brought the batteries up in about a day. Only did it to see how the station battery

would fair in a power failure.

The only down side is that every few years (usually about 5 years) the batteries need to be replaced. NOT real cheap, but by the same token, I've NEVER had an equipment failure due to a power surge or other problem. Things like a pass transistor in a power supply or something shorting and putting high Voltage on the equipment.

How does this relate to my Baofeng radio. Well, in the event of a power failure I could charge it using the AC Inverter :)

I have a few of the HF meters. They have a widetolerance. I've had a couple that jive with myold RS meter, but some are off by a bit. YMMV
The only good point of these Centech POS is the 10 amp
current meter, and if it burns up, it's like a Baofeng.
Toss it.
From: "Christopher Young cayoung@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

Using my high quality free with coupon and any
purchase meter.

Your wet batteries are outside of your operating area.That solves the acid/gas problem.

Chris:Batteries generate hydrogen when in use and when charging.You really want wet batteries outside. SLA have things to
recombine the gas back into the acid, but will vent if theyhave to. (prevent shorts)
From: "Phil ko6bb1@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

Backup power, hmmm. . .

Let's see. I only have 3 12 Volt 120 Amp/Hr deep cycle batteries (360 Amp/Hr total) tied in parallel, in the shed adjacent to the radio room wall (about a 10 foot run of 4ga wire). It's tied to the 12 Volt (actually 13.6V) DC bus just under the operating table to which is tied ALL the radio equipment except portables and the Regenerative receiver. Also a FT-1900 2M rig, the computer DSL model and router, a 300W AC inverter (for small 120VAC needs and so forth). ALL of this is kept on float charge 24/7 via an Astron LINEAR PS (no noisy switching PS here).

I'm with you, if one of those free with coupon meters
goes up in smoke, I don't get too upset.

And they do some useful ranges, and scales. Not
yet tried the transister checker, never had a need.

They do have a small fuse inside. If one goes bad
for other reason, I save the leads and fuse.

The couple times I've seen or known of problems,
one was an old farmer using 12 volt blast setting
on a wheeled charger, and then wiggled a clamp.

Other problem was when I left a HF float charger on,
and the thing elecrolyzed a quart and a half of water
out of my marine battery.

Another time, the battery stored ouside was frozen
solid, the day I needed it.

Other than that, I've not had much trouble with car
batteries. Don't want to store it outside for theft or
freeze damage.

Topic: 54210 Message: 54339

First, as a side note, I've been 'doing' radio and electronics for over 60 years (started back around 1953 when I was 10), and made my living in it for all of my working life, including military, Government Contractor and a stint as a "Standards Lab Engineer (Metrology)" in the Microwave Standards lab at General Dynamics, Pomona. I HATED THAT COMMUTE, reason I quit. So I do know a bit about test equipment, and electronics in general (most of my life I specialized in various RF fields).

I have quite a few DVMs, as well as a Heathkit V7-A General purpose VTVM, Heathkit IM-21 AC VTVM (good for Audio work) and other meters. My 'flagship' DVM is an old RS 22-174B True RMS Meter (no longer available) that has been calibrated against Fluke Lab gear and found to be VERY accurate. I also have a Cen-Tech P98674 meter (bought for some special functions it has) that in ALL functions measures within 1% of the RS unit. I'd say that's pretty good!

Also in my arsenal of meters is a Cen-Tech P37772 meter (the red one with fold up display). That one was bought for a "Tool Go-bag" for times that I don't want to take my 'good stuff' out of the home-lab (like working on somebodies mobile radio installation). I've found it also is VERY close to reading what the other two meters read in all ranges, though I won't specify how close as I've never run a chart on it. MORE than adequate for even serious home use! Some folks have reported reliability problems with it, but I've had absolutely NO problems. Think I paid about 12.00 for it when HF first opened the local store and ran a lot of unadvertised specials.

When they first opened the local store they were passing out "free, no purchase required" coupons on a lot of stuff. I gave away a couple dozen of those little red DVMs to local hams for their go-bags. Also still have a LOT of their cheap yellow AA & AAA batteries that I got for free. Yeah, they don't last as long, but the price is right!

I DO have two of their small Freebie DVM's Velcro'd to the front of the top shelf on my Workbench where a lot of test equip, consisting of 2 VTVMs, 2 signal generators, signal tracer, homebrewed 4 output Power supply (5 Volt, 12 Volt and two adjustable outputs). One of the DVMs is hard-wired through a 2 position toggle switch to read the adjustable outputs on the bench supply.

On the left side of the bench is the Oscilloscope on it's cart, which also holds the digital function generator (.1Hz to 2mHz, various waveforms) and the 2.4GHz Frequency Counter, Another 12 Volt 20 Amp PS along with some other stuff.

The other "freebie" meter that is Velcro'd to the bench shelf is there for quick checks, things like checking batteries, cable continuity or any other quick test I want to make. It saves having to take one of the 'good' meters out of the bench drawer. By the way I DID calibrate it (internal calibration pot) on DC Volts against the RS meter (my personal shop standard) and it is now quite accurate for that purpose. Resistance accuracy is 'fair', good enough for determining if a resistor is 470 Ohms or 4.7K when the color codes are hard to read (many Chinese color coded parts are hard to differentiate). Where it's mounted it's a VERY handy item as it only takes seconds to check a lot of routine 'stuff'.

So yes, those cheap Cen-Tech Meters DO have a place in the home shop, so long as you know their limitations and can live with that ;-)

The couple times I've seen or known of problems,
one was an old farmer using 12 volt blast setting
on a wheeled charger, and then wiggled a clamp.

Watch for sparks, you can ignite the hydrogen.

Other problem was when I left a HF float charger on,
and the thing elecrolyzed a quart and a half of water
out of my marine battery.

Overcharging cooks the water out of batteries.

Another time, the battery stored ouside was frozen
solid, the day I needed it.

Other than that, I've not had much trouble with car
batteries. Don't want to store it outside for theft or
freeze damage.

They only freeze when they're discharged.

Another tester I really like is a PR-2 flash light bulb and about 8 inches of 12 or 14 solid wire. Loop around the bulb, and make the wire into a C shape, bulb at one end. Touch one end of a 1.5 volt cell to the lead spot, and other to the wire. Easier than it sounds, after you've done it a few times. Good practical test for AAAA through D cells.

Reminds me, I oughta have a HF - VOM in my radio bag. Well, not needed it yet. Might need it next time out. I did give a freebie away to a highly capable friend of mine who was travelling with out a VOM. Oops!

I worked at a Calibration standards lab too for awhile NEC 1589 1588.

We had a type 3 lab and I ended up in the RF screen room doing the 1ghz to 26.5 stuff.

Interesting and fun, we also did repair work too along with the shipyard TE.

You cannot get any better training on Test Equip working in a lab.

Do they even have a lab in Pomona anymore?

From: Phil
Topic: 54348 Message: 54348

Tomorrow I'll be making an order from Amazon to restock a lot of my parts (caps, resistors etc) along with some other needed bench items.

I thought that IF it fits the remaining budget I might go ahead and order the TYT charger for the UV5R I have. Somebody here recommended it some time back, but I seem to have lost that email (or can't find it amongst the thousands here, even though they're sorted by subject.

I considered "Diodeing down" the 13.6 Volts from the station battery to 10 Volts for the UV5R charger. I have a 'gazillion' 1N400x series diodes. 'Silly-cone' diodes typically drop ~.6 Volts, so about 6 of them would give the Baofeng charger ~10 Volts, or close enough for ham use anyway.

So, what is the model number of the desired TYT charger please?

I don't think I've seen the "desktop charger" for the TYT available on Amazon, but they do have the car charger from TYT on Amazon which fits the UV-5R extended battery, and works WELL.

http://www.amazon.com/Charger-TH-UVF8-TH-UVF8D-TH-UVF9-TH-UVF9D/dp/B010CMAJRO/ref=sr_1_1?ie=UTF8&qid=1450239463&sr=8-1&keywords=tyt+charger http://www.amazon.com/Charger-TH-UVF8-TH-UVF8D-TH-UVF9-TH-UVF9D/dp/B010CMAJRO/ref=sr_1_1?ie=UTF8&qid=1450239463&sr=8-1&keywords=tyt+charger

I purchased my TYT desktop charger from here...

It's not JUST the input voltage tolerance, the TYT charger is generally better designed and better built -- I've never heard of a TYT charger where the factory forgot to solder the leads to the board or left cold solder joints -- both of which are too common on the baofeng factory chargers

"... so about 6 of them would give the Baofeng charger ~10 Volts..."

Or, you could just get one ~3.6V zener diode. (rated for the expected current, of course).

:)

When I took my radio class, the instructor had a
couple microphones for practice. I'd forgotten how
I used to always end my CB transmission wiht over
or go ahead.

I'm also in the habit of waiting a full second after the
other guy unkeys, before I transmit. Gives others a
chance to get in. One guy used to retransmit if he
didn't hear me in 0.00001 seconds. He did that about
a dozen times, kept asking if I could hear him and
if I was there. It took me a long time to get him to
calm down a bit and allow the full second for others
to have a chance.

From: Ray Sills
Topic: 54355 Message: 54355

Hi Gang:

I have a couple of them as well. Sure, they are not lab grade, but good enough to know some important info. Like those things mentioned: resistor value (when color codes are hard to read).. voltage levels, and my favorite: voltage polarity. Many of us have a box or two full of wall-wart power bricks, and even though they usually specify the polarity on the device itself… I always check with the little red DVM.

I also use them to check continuity and (again) proper polarity when wiring up cables. And, they are good to check out the charge state of small batteries, like the ubiquitous 9 V and AA cells. The battery check mode puts a modest load on the battery, and shows the delivered current. If that battery is good, it will deliver the proper amount.

And, as others have said, you can’t beat the free price. The Harbor Freight pocket flashlight is pretty handy (and often free) to have. I keep one in my pocket all the time. As you might expect, the “free” aspect draws me into the store, and I always find something else that I need. So, the advertising ploy has done it’s job. :)

I bet a ham club could work out a deal to buy a case of these meters for a very low price, and use them as part of a training course for new hams, or as a little reward for finishing the course… or passing an exam. My feeling is that those meters cost HF about $1 each, and that they can take that as an advertising expense, since it draws customers into the store.

Gotta chime in here, if only because it seems like people are splitting hairs.

I have to say that there is a time and place for a LOT of stuff on repeaters, but it appears that there is a summary judgement against those that will use a Q code on a repeater or pass the ball by saying someone else's call sign.

big sigh

Lighten up. Look, a lot of Hams switch back and forth between HF and Repeaters quite a bit. If someone says "QSY to XXX.XXX" relax. It's quicker to say that than "Switching to frequency XXX.XXX" and they probably say that a lot when working HF. It's OK.

Graham, you have a LOT of GREAT information there. In fact I would have to say it's probably the most thought out post on this thread. BUT when doing a roundtable discussion sometimes it is EASIER at the end of your transmission to say the next person's call sign then yours. Every morning we have upwards of 6 people talking for upwards of 2min each turn while we are doing all sorts of morning things (most of us are walking the parks), which means when this happens you kinda HAVE to ID at the end of every one of your transmissions because it's 10 min before the ball gets back to you. And just so you know this goes on for about 2 hours straight.

So why do I bring up that example. Sometimes the "rules" don't work on every repeater. Accepted practice for one type of conversation may not be acceptable for another. Be flexible and "Be nice", and most of all HAVE FUN!!!!

Don't sweat the small stuff. Go with the flow. BUT remember that how you operate on the informal rag chewers net from 0630 to 0830 is NOT how you'll operate on the Honolulu Marathon Net or the nightly EARC net. Remember your basic rules (give the FCC their 10 cents), be courteous, and most of all don't be a total lid. EVERYONE is going to put their foot in their mouth at some point or screw up something. If someone says they haven't or they don't, guess what. They are LYING! We're all human and we all make mistakes.

OK.. I think that's it. So in closing.... Graham's three links are GREAT!!! I couldn't agree more. But be a little flexible and "consider your audience" when on the radio. Leave some space for breaking stations, and remember NOBODY is perfect!

54363. Ordered a "real" FTDI cable today

Yahoo group: baofeng_uv5r (2015)
Date: 2015-12-16 17:15:16 UTC
From: Phil
Topic: 54363 Message: 54363

Well, I got tired of having to reload the *old* drivers every time I wanted to use Chirp to program my UV5R. I have Win7 updates set to "notify me of updates but let me select which I want to download/install". Even then, it seemed like every time I wanted to use my cheap "Phony-Baloney" cable I had to reinstall the drivers (even on the same USB port).

So anyway, I popped for a real FTDI cable from BaofengTech today. It was about 20.00. Also ordered a spare Lithium battery for the radio. With the spare battery, Phoney-Baloney cable/software, long whippy antenna, speaker mic and now the new cable and battery, I have far more invested in accessories than I do in the radio itself ;-) Of course IF I had a Yaesu FT-60 (my all time favorite HT) I would have far more than that invested, even the drop-in charger is optional on that radio. . .

No, I didn't go to the other site and order the TYT desktop charger. That'll have to wait for the ol' bank account to get replenished.

This was ordered from Amazon as I had to "restock" my dwindling parts supply for the bench. The PRIMARY reason for the order was to buy some resistor, capacitor and transistor assortment kits as they were my first priority! It's much cheaper to buy an assortment than to buy individual parts from some place like Mouser. Also needed some BNC test equip cables and other items, and I can't run to RadioShack to grab a badly needed resistor (at inflated prices) as there are no longer any RS stores in the entire central valley area!

Hi Phil,

Get a simple buck regulator. With care, you can fit it in the UV5R charge base, and set it to just under 10V output

You can then input anything up to (in my case) 40 volts! It does not get hot, as it is a switched mode design and very efficient. This was my final solution, having tried diodes (got hot) and a linear regulator, (in my case a 7805 that I then adjusted the voltage on). Also got hot.

Just bought a bunch of those regulators from Hong Kong. Paid 30c for them. Yes, 30 cents of your money!! OK, the postage made it higher, and they came in at around $1 apiece, having bought ten.

http://www.ebay.co.uk/itm/251457946719?_trksid=p2060353.m2749.l2648&ssPageName=STRK%3AMEBIDX%3AIT http://www.ebay.co.uk/itm/251457946719?_trksid=p2060353.m2749.l2648&ssPageName=STRK%3AMEBIDX%3AIT

You will need to cut the traces, feed the input from the jack to the regulator, then feed the output from the regulator to the traces the jack used to be connected to. As the regulator is common negative, you'll only need to cut the positive trace.

For a 400mA charge, you will be taking around 325mA from a 13.8V supply. And about half a watt of heat from the whole thing. If your battery drops to 12.5, then it will be a little more current. Just two diodes will get you a drop of say 1.4 volts, and dissipate .4A x .7, 280mW each. And two diodes is not enough. So not the way to go

Alternatively, you can buy one of these... About $14.

Car Charger Cable For UV-5R UV-5RB Fix 10VDC Output (Dont use the direct cable) http://www.ebay.co.uk/itm/330865383274?_trksid=p2060353.m1438.l2649&ssPageName=STRK%3AMEBIDX%3AIT

While I might criticize Amazon over some other aspects of their operation (especially reselling returns as "new"), the Amazon SMILE program is terrific! Many sites will let you check off to donate some small portion of your charges to a charity, but most of those sites have a very limited list of charities to choose from. Amazon lets you choose to donate to ANY organization that is qualified by the IRS under section 501(c)(3).

One small problem is that the process to choose your charity isn't very user friendly because Amazon links directly to the IRS database of all 501(c)(3) non-profit organizations and the IRS list has some problems. For example, if you wanted to donate to your LOCAL Red Cross Chapter, you could do that, but first you have to find your local chapter in a list where the IRS uses the name AMERICAN RED CROSS for every chapter in the country. To be sure you get the right organization you need to watch both the name and the city & state where that organization is listed. Again, using the example of choosing your local Red Cross chapter, you would scroll through hundreds of listings for AMERICAN RED CROSS until you came to the one listed for your city and state. The same thing is true for other national organizations with local branches or chapters, ALL the local offices are listed under the name of the national organization but just with the city and state to tell them apart.

If your local ham radio club has gone through the paperwork to be a 501(c)(3) non-profit organization, you could choose to donate to them -- or to any other local charity that you like. Amazon Smile doesn't cost you anything at all (it also doesn't pay a lot to the charity unless there are a lot of people donating) but even a small percentage adds up over time.

From: mailto:baofeng_uv5r@yahoogroups.com

I didn't know we could donate to AMSAT this way. I'll have to give it a try.

John
KJ6IBP

I also wish to point out that Amazon has a charitable contribution program, you can pick which charity will receive some percentage of your purchase price from Amazon. My organization is AmSat so that is why you see the smile.amazon in the URL. I hope you will choose to support our hobby by supporting the organizations that support us.

All Absolute Rules Are Bogus - Including this one!

Seriously, what is and isn't problem on a repeater varies from one area to another, from one repeater to another in the same town, and sometimes even at different times on the same repeater.

Yes, the rules were changed so you no longer have to be smart enough to remember who you are talking to -- and you do NOT HAVE TO give the other station's callsign -- but that doesn't mean you cannot, or even shouldn't ever give another station's call. I've seen several different cities with repeaters where a round table is common, especially in morning drive time. In many of those round tables, it is common practice to end a transmission with 'Over to w4xyz' or more often simply 'Over to xyz' indicating the next operator in the rotation. Is there anything wrong with that? No! Would you routinely give the other station's call at the end of every exchange in a simple two-way conversation -- generally not -- but the world is not going to come to an end if someone does it.

Many phrases and expressions have become commonplace and accepted today that still grate on the ears of old timers. I've seen guides published that recommend things that would have gotten you laughed off the air even 20 years ago.

Subject: [baofeng_uv5r] Re: One more ?

Gotta chime in here, if only because it seems like people are splitting hairs.

I have to say that there is a time and place for a LOT of stuff on repeaters, but it appears that there is a summary judgement against those that will use a Q code on a repeater or pass the ball by saying someone else's call sign.

Rick has a point. Perhaps we all should just answer with yes, send your
$14.95 renewal fee every 90 days to:

Bureau of the Fiscal Service
Office of Public Debt Accounting
ATTN: Ham Test Renewals
P.O. Box 396
Parkersburg, WV 26106-0396

I suppose I should add (for some on this list), it's a J-O-K-E.

The W5YI VEC place. Not only do they charge the $15fee for a test and $15 for a retest, they send outthe "friendly reminder" letters along with the ARRL.The ARRL notice tells you on the back that can renew for free athttp://wireless.fcc.gov/uls/index.htm?job=online_systemsthe W5YI letter (FCC605VEC) sent out did not have that info.

As a VE for Laurel I find that appalling.
We don't charge fees for tests or renewals.

As I see it, the charges for having a company enter your name and callsign into the FCC website for free services are about the same as the charges for RT Systems software or a "Real" FTDI cable -- if you are too foolish or too lazy to do something simple for yourself then you should expect to pay someone else to make it even easier for you.

That's for the people who are too stupid to know what "Expiration Date" printed on the license means.

The last time mine was about to expire I got 2 or 3 letters from companies that charge money to renew your license for you. I suppose somebody makes money doing that.

Tom

Of course the difference being that an FTDI cable (no matter where you purchase it from) costs more than a fake illegal Prolific cable from China for your Baofeng UV-5R, plus neither cable is free. The same can be said for commercial software (of any type) vs. freeware for the UV-5R and the cost to support it.

As a group, hams generally want vendors to give them everything for free (or as close to free as possible), yet those same hams rarely (if ever) provide their own services (whatever they may be) for free. Never met a plumber, doctor, carpenter, locksmith, police officer, dentist, teacher, painter, bus driver, etc., etc. willing to give away their time, products, and services completely for free, yet if they're hams nearly ever one of them wants communication, electronics, or computer products for free - plus many of the now retired former union or military folks expect benefits and/or pensions for life.

So if those of us (still working) are to pay for those benefits and pensions (and I'm not against paying for what was earned), perhaps you can explain how to do that if business folks can't make a profit? Last I checked, profits are what drives the U.S. economy. Without it, we live in a stagnant economy - like we have for the past 7 years.

I'm not employed by RT Systems, and have only met them once at a hamfest several years ago, but those folks work really hard to provide first-class service and support to their products. No one forces any ham to purchase their products, but 99% of us that use their software and cables recognize the fact the quality products cost more to produce than simply copying somebody else's work. Never met anyone from W5YI, but hams will decide if the service they are providing is worth the $29.95 they are asking for help with vanity callsigns. Of course the same can be said as well for ARRL membership, local repeater club dues, etc.

The UV-5R (and variants) are actually easy to program. They are even easier to program when all you will be doing is receiving.

You can get the frequencies that you want to listen to from the RadioReference website.
https://www.radioreference.com/apps/db/?ctid=2255

Don't bother with frequencies that aren't between 136.000-174.000 MHz and 400.000-520.000 MHz. If the Mode is P25 then forget it. Don't worry about Tones, you don't need them to listen.

I would suggest you find a local ham club, or ARES group, or RACES group, and go to their next meeting. You will meet a lot of nice people who can both give you hands on help with your radio, as well as help studying for and getting your ham license.

As someone else noted, without a license, you can't transmit with that radio. It is only legal on Part 90 (business & public safety) and Part 97 (amateur) frequencies, and you need a license for both of those. Of course, amateur is what you would pursue as an individual, a Part 90 license would be obtained by a business or government entity. If you work for a company or government entity that has Part 90 licenses, check with their radio shop for help (and permission) to get the proper frequencies in your radio.

I would also add to the already posted information regarding Part 90 that not all Baofeng radios have the FCC Part 90 certification. Many of the very low cost UV-5R's that you you see being sold (primarily on Amazon and e-Bay) do not, and many of the UV-5R variants do not either (like the BF-F8HP radio). An easy way to tell is to simply look at the metal backing of the radio being purchased (once you slide off the battery). See attached picture.

54401. Baofeng UV8r and mobile device tnc

Yahoo group: baofeng_uv5r (2015)
Date: 2015-12-21 20:41:29 UTC
From: davidlday@...
Topic: 54401 Message: 54401

I just attempted to connect my UV8r to a mobilkind TNC. Got as far as connecting via Bluetooth to my android phone. While attempting to get the transmit to work, the radio went through several cycles that looked like it was resetting, and ended up re initializing everything to factory defaults in the radio. Now I can no longer enter a frequency into the radio from the keypad. I checked menu item 33 to make sure the band was correct for the frequency I was entering without luck. I get to the 6th digit of the entry and the radio just cancels my entry and reverts to 000.000.

Anyone else have any other ideas what I might try. Even a full reset to factory defaults does not work.

Thanks
n1DAY

This may seem ignorant, but what does the band function do in the menus? I seem to be able to tune either band regardless of the setting when in vfo mode. does it inactivate something if I'm on VHF band in menu but tuning UHF?

Hopefully you have a programming cable and CHIRP?
Sounds like your upper and lower frequency settings may be wrong. In "Other Settings" there are two sections for VHF and UFH. You want something like 140-150 and 430-440.

As I recall...early UV-5R's you had to switch bands to put in the correct frequency. They eventually got rid of that silly requirement and the button is just a vestige of days gone by now. But it's not worth retooling for it.

When these radios first came available in late 2011/early 2012, the user had to select the BAND and STEP that was compatible with the frequency that was to be keyed into the VFO. The BAND setting wasn't really being used for anything so it was obsoleted in later firmware versions. The requirement no is to key in a step compatible frequency that is between the VHF or UHF band limits.

The [BAND] button was removed from some radio models but menu 33 (BAND) still remains.

Well, it doesn't take a "hot-rod" of a computer to run Chirp, "Chirp" isn't resource intense . All it needs is a machine that'll handle a USB port, and CHEAP used XP machines from a thrift store or whatever, will do that.

On the other hand if you're "income impaired", surely you have a friend who has a computer of whatever flavor that can handle a USB cable/ / /

It is apples to oranges comparing an android device for programming a radio and a $$$ computer. I bought a Windows tablet for $80 and I've seen laptops recently for $125.

This has been discussed on the CHIRP mailing list recently. The Android OS is missing several pieces that would preclude CHIRP being ported over to it.

A Linux-based LiveCD is available with CHIRP pre-installed. This will boot on almost any system and provide a highly-compatible CHIRP environment without the need for fussing with a driver. It will not modify your system in any way.

* CHIRP Linux-based LiveCD <http://sourceforge.net/projects/chirplivecd/>

Couldn’t one of you old timers make this into an Android app?

Yes, why don't one of you "*old timers*" that are also software programmers devote more of your free time and loss of income into a project (Chirp) that's already free (so that someone else doesn't have to spend $50 for a thrift store laptop perfectly capable of supporting Chirp hardware requirements)?

Geez, guys, don't want much, do you?

Indeed.
For all but the latest firmware it is not needed.
It still can be used to generate a time when PTT is pressed.

Interestingly the bf-f8+ does not have a band button at all.

Someone was doing at the Ham club, however they said after trying a few tablets one version seemed to work (possibly others) I do knew I saw the model manu a few months ago on sale at Rite Aid for $50.

Some sort of adapter is used, the particulars I will need to ask about. I know they were very happy to be able to do this in the field without dragging a laptop around. I am on vacation out of the area so will find out they actual did after the Holidays.

Hi Christopher

"Has anyone talked a battery to exhaustion? How long did that take?"

I had my UV-5R with the BL-5 battery on from a Tuesday Noon, till it died on Sunday around 5:00 PM. That was about 125 hours with 20% transmit and 80% receive on a somewhat busy frequency. On Sunday the Rx-Tx ratio switched to 60% Tx and 40% Rx for about 3 or 4 hours.

The battery was brand new at the time, fully charged for about 24 hours prior on the TYT charger, and the radio was on high 5 watts output. Squelch was I think at 1, with the AV-85 antenna.

The radio was in a shoulder pouch and slung over my right shoulder. And I was using the Baofeng external mic.

I am sure a single occurrence does not produce a trend, but this is an example of what can happen.

Hi Christopher

"What other colors can be found?"

I found yellow, red, and orange, in addition to the black, blue, and cameo you mentioned. My problem is that the battery is still black.

I wish they made colored battery cases as well.

There are colored batteries available, but since they normally cost more for dealers to get, 99% of the customers end up buying black anyway.

A can of spray paint and a small piece of masking tape will give you a battery in any color you choose.

The radios are hard to paint, but the batteries are easy.

Very true, although painted batteries aren't quite the same as ones with injection molded ink throughout the plastic case, but it does allow an end-user to custom color code their radios to match their own Pantone color shade preference.

54435. Cheap (almost no cost) 13.6 Charger adapter for my UV5R, Another long ramble.

Yahoo group: baofeng_uv5r (2015)
Date: 2015-12-24 05:52:37 UTC
From: Phil
Topic: 54435 Message: 54435

Howdy,
Awhile back I first asked about which TYT charger I needed for the UV5R, thinking I might order one with last week's Amazon order. Well, I didn't find the TYT unit on Amazon, though the 409shop had them.

In the end things worked out for the better. If you remember I mentioned that I might make my own adapter to run the existing Baofeng unit on the 13.6V station battery, using a string of diodes to drop the Voltage to about 10V. A couple kind folks pointed out why it night not work (diode heat etc) or to order a "Buck" Voltage regulator (not a bad idea).

Well, I did place my Amazon order last week. For an early Christmas present 'Wifey' slipped a couple hundred extra bucks into my monthly "hobby budget" and told me to get what I wanted or needed most (being retired we're on a tight budget and I plan ahead for any and all purchases).

My first thought was a couple pieces of modest test equipment I've been considering (a 50 Ohm Step attenuator and a couple other small items).

But one big problem here has been "parts availability", especially since ALL the Radio Shack stores in the Central Valley of California are now closed. Their parts, for example a 5 pack of 1/2 Watt resistors were greatly over-priced, but a life saver whenever a project came to a screeching halt for lack of a small part. My 'bench stock' of all such parts was running very low (I bought some for pennies on the dollar when the local RS store closed, but nowhere near what I needed, and they were still overpriced). I like to do a lot of building, experimenting and repairing of radios (been at it for over 60 years).

So last week I placed a large order from Amazon (35 different orders). Among those items were three DIFFERENT resistor assortment kits(1W, 1/2W and 1/4 Watt), 4 different capacitor assortment kits (yes there was some overlap in some of the values, but I needed everything from ceramic caps to Mylar to electrolytic caps of many types), Five 5 packs of BNC Chassis mount connectors (my connector of choice, they were real cheap), six 6 foot long RG-58 cables with BNC connectors, a couple 4 foot RG-58 cables with BNC on one end and gator-clips on the other, a couple different Transistor and Semiconductor assortments, and more stuff that I don't recall off the top of my head.

Oh, I also ordered a spare Lithium battery for the UV5R for the princely sum of 9.00 (this keeps it On Topic for this list). I also ordered a real FTDI cable for the UV5R (at 72 life is too short to have to keep reloading the OLD driver for the FAKE cable, I've had to do it 3 times

now :)

One shipment came in Monday with the battery, a couple of the capacitor kits and some other items. Two more shipments are due in tomorrow (they're actually the two largest shipments and the FTDI cable is in that batch). After that a whole bunch of small mailings from China will trickle in one by one. It's amazing, you can order a package of 100 2N2222 transistors (or other items) for a couple dollars with free shipping direct from China included. Typically they say a month to a month and a half shipping time, but EVERY time I've placed an order like that they've arrived in less than 2 weeks, usually in a small plastic bag with internal packing for security! When the last item I ordered like that arrived, the customs tag said "Industrial Samples". . .

All in all, this time I ordered nearly $300.00 worth of parts and etc (ALL with Wifey's blessings). I shouldn't need to order any parts for quite awhile now.

OK, now to the subject at hand. Today I went ahead and bread-boarded a small PCB board with 6 diodes to "diode down" the 13.6VDC of the "station battery" to 10 Volts for the factory Baofeng charger, put it in a small plastic medicine bottle with a wire out each end. On the input end I put a cigar lighter plug (salvaged item), on the other end a plug to fit the Baofeng charger. Plugged it into one of the 13.6V outlets over the operating table, then into the charger and measured the Voltge across it (with no battery in it). It measured right at 10 Volts. Plugged a battery into the charger, the red light lit and the Voltage dropped to about 9.2, the red lamp seemed a bit dim. Disconnected, opened up the medicine bottle and jumpered one diode, connected it all up I had 10.2V on the charger input with no battery, connected a battery, red lamp lit and the input Voltge measured 9.6V, lamp was about normal brilliance.

GOOD enough. Left the unit hooked unit up and put it into operation for awhile, diodes ran nice and cool, just about room temp.

Yeah, it's NOT hard regulated at a set Voltage because diodes aren't linear Voltage droppers with changing current, but it's close enough and the charger itself should regulate the actual charge level just fine.

COST?? Almost nothing, I had a bunch of 1N4001 (50 PIV) diodes that I don't use as I like to use a higher Voltge rated diode when I build things (but they're more than good enough for this job, especially with 5 in series). NONE of the other parts cost me anything either as all were salvaged from stuff I tore apart, and the medicine bottle was free as one of my prescriptions came in it. I have a whole bag of them.

With a stable voltage on the input, diodes will be fine. Probably not
a good idea if you tried to use this in the car with the input voltage
constantly varying between 12 and 14 volts. In that situation I would
go with the buck regulator or one of the 3-terminal regulators (I
bought 7810 3-terminal regulator for 50 cents on ebay)

Trying to program my new UV-5Rs and every time I try to clone the radio using chirp i get the message saying "Radio did not respond" . I have tried using different computers and plugging usb connector different ways etc. Verrry Frustrating. Any ideas ?

First, Merry Christmas all,
Another of the (35) items I ordered from Amazon last week arrived yesterday. This package contained the 'real' FTDI cable from BaofengTech. All I can say is, IT WORKS as it should. Plugged it in, the 'puter loaded the proper drivers and I was off and running.

Here are some things I noted.
1. Didn't need to go out and look for old drivers to make it work. Loading old drivers are OK if it's a one time deal, but it seemed that my 'puter always updated them (and my Windows update is set up to ONLY update after I give it the OK). Several times I went to load something into the UV5R only to have to first reinstall the cable stuff. At 72 life is too short to go through that time and again.

2. The radio end of the cable was a MUCH better fit to the radio, easy to plug it in and unplug it. The pin spacing on the 'Phoney Baloney' cable seems to be off just a little bit. You really have to mash it in (no it's not a "trim the plastic thing). I'm afraid that repeated use might eventually damage the radio jacks (understand they're not reliable anyway).

Well, I hated to pay $20 for a cable to program a $26 radio, but at least it works well and I don't think it'll damage the radio. And of course, IF I buy another radio that uses that interface (Baofeng, Truetone and I think Kenwood) I've got the cable :)

From: Phil
Topic: 54443 Message: 54443

First, Merry Christmas to Everyone here who celebrates it, (not to get preachy, but "He is the reason for the Season").

OK, now to get "On Topic" for the Baofeng list. Since I received my 'real' FTDI programming cable and it works well, I really don't need the Baofeng "Phoney Baloney" one. If you download the correct drivers from Miklor.com it DOES work, it's just that messing with the driver issues aren't my cup of tea.

As a late Christmas Present I'll mail it along with the mini software disk (which I haven't even used) to somebody who NEEDS it to program their Baofeng radio (and are savvy enough to understand that they'll have to download/install the drivers). And I'll even pay the postage (I'll only mail to the lower 48 states :)

Please, if you already have one or otherwise don't need it, don't ask, let somebody who does need it have it.

In the subject line please put "Baofeng cable or similar and respond directly to

From: Mike WA6ILQ
Topic: 54444 Message: 54444

Someone else must have had this happen before.... and at
my age I don't have time to reinvent someone elses wheel....

So a CERT member emailed me with a problem of a dead UV5.
Seems that he left the radio on overnight, and totally discharged
the battery. Dropping the radio, or the battery alone, into the
charger gives the impression that the battery or radio isn't there
at all. But leaving it in the charger for two days results in the battery
showing 3.15 volts.

Another UV5 battery reads 8.2 volts (label says 7.4....)

This tells me that one of the cells is probably shorted.

Anyone know how to fix it, or does the owner need to buy a new
battery and pitch the old one into the e-waste collection bin?

Over discharging a lithium battery can ruin it. He probably should get a new one.

Yeah, at $9.00 brand new on Amazon they're not worth the effort of
trying to rebuild them (no so with many of the older name brand HT's
with NiMH batteries which cost far more)

In fact last week I ordered a "spare" for my nearly new UV5R. I've
never run the facotry battery downbefore putting it in the charger, but
it's added peace of mind.

Thanks to these two gentlemen for the answer.

I'm kinda surprised that the radios don't have a low voltage
cutoff to prevent this kind of damage.

Oh well.

From: Mike WA6ILQ
Topic: 54210 Message: 54450

An acquaintance used his radio for most of the day, then put it up on top of the dashboard, drove home, and forgot the radio over the weekend, thereby totally discharging the battery. After two days sitting in the charger (but never going into charge mode) the battery shows 3.15 volts, where as another known good battery shows 8.2 volts (however the label says 7.4....).

So it looks like the battery was killed by leaving the radio on past the low voltage announcement and going into fully discharge.

So you might keep in mind that these radios do NOT have the common low voltage disconnect feature to protect the battery.

Doesn't surprise me at all. What do you want in a radio that you can buy brand new WITH battery and drop in charger for about $26, when a battery alone for any of the "name brand" radios will cost you more than that.

The key is, be careful, watch how you use (or abuse ;-) them and just buy a new battery for $9.00 if you screw up. . .

I've got three radios and ten batteries: 2 3800, 2-2100, 6-1800 mAh.

They are numbered 1-10 and rotated in order.

But in almost every use, the battery is left in the radio until the display goes blank, then immediately recharged.

I'm still waiting for my first battery to fail.

>
> Anyone know how to fix it, or does the owner need to buy a new
> battery and pitch the old one into the e-waste collection bin?

one shorted cell is one option. Two Cells with very little voltage
the other option.

First. To be on the safe side buy a new battery.

Second. As you are a HAM you could try the following.
- The loader expects a certain voltage readback to start loading.
- If there is no sufficiant readback no loading

now use your voltage source with current limitation to fix this ;)
- unplug the battery
- put your voltage source to 7.2V 1A
- connect it to the appropriate contacts at the battery for a short
time (just a few seconds)
- measure the voltage of the battery
- repeat the steps till the battery shows at leas ~6.V
- try to charge it again.

Please keep in mind. This is potentially dangerous. Do it outside, or
at least in a well vented room within a fireproof kiln brick or something
like that.

Maybe the 9 bucks for a new battery may be the better option anyway ;)

Greetings Daniel

54454. UV5-RE Voice confirmation

Yahoo group: baofeng_uv5r (2015)

From: dtgolder@...
Topic: 54454 Message: 54454

Hi all...new to the group

Picked up a UV5-RE a while back....and now picked up a second align with a programming cable for CHIRP. Some questions though....

Starting both radios with 3 pressed show the same firmware version--but if you look at the firmware fields displayed in CHIRP the show different firmware versions on each radio (and not what is displayed on startup with button 3). Expecting this is normal and just a quirk of the radios, and that I will need to treat them as having different firmwares (was hoping the would have the same firmware but no luck). Hoping someone can confirm.

Second question is scanning...

Both radios announce "Scanning Begin" when initiating scanning, but only one radio announces "Scanning Stop". The second radio has no announcement (although it appears that a key press stops scanning, just without a voice confirmation).

Wondering if this is normal too, and just part of the alternate firmware version? Or is this a bug (and I need to return the radio?) Anyone else not getting the "Scanning Stop" voice confirmation?

Thanks for any assistance...

Baofeng started hiding the firmware version with the release of BFB299
over 2 years ago. Since then the all say BFB297 in the power up
message regardless of the "real" firmware version. Needless to say,
the power up message is no longer useful except for knowing that the
[3] key works.

I would be curious to know the "real" firmware versions of both
radios. It would seem to me that radio #2 was manufactured before
radio #1.

As I mentioned above, radio #2 might actually be older. New old stock,
refurbished, etc. The "real" firmware versions may confirm my

suspicions.

Either way, as long as both radios work, it isn't really a big deal. There hasn't been a firmware version released that would make me choose one over another.

Another possibility nobody seems to have mentioned. Did you turn the radio volume up or just turn on the radio with volume low. Work better with volume up so computer can hear the output. Don T. -- K5ZRQ

  First, Merry Christmas to Everyone here who celebrates it, (not to get
preachy, but "He is the reason for the Season").

OK, now to get "On Topic" for the Baofeng list. Since I received my
'real' FTDI programming cable and it works well, I really don't need the
Baofeng "Phoney Baloney" one. If you download the correct drivers from
Miklor.com it DOES work, it's just that messing with the driver issues
aren't my cup of tea.

As a late Christmas Present I'll mail it along with the mini software
disk (which I haven't even used) to somebody who NEEDS it to program
their Baofeng radio (and are savvy enough to understand that they'll
have to download/install the drivers). And I'll even pay the postage
(I'll only mail to the lower 48 states :)

Please, if you already have one or otherwise don't need it, don't ask,
let somebody who does need it have it.

In the subject line please put "Baofeng cable or similar and respond

The N5R-213 firmware is a common firmware version that was put into most UV-5R type radios. First appeared around September 2014.

The HN5RV01 firmware is a custom firmware. First appeared around May 2015.

I'm not surprised of the difference.

The data is transferred to and from the radio using serial communications at TTL levels (0 volts and 3.3 volts). The programming cable only has three wires: TXD (serial data out), RXD (serial data in) and ground. There are no wires in the programming cable for speaker audio out or mic audio in because they are not needed. In other words, there is noting to "hear".

I know that some say this makes a difference, but in nearly 4 years of constantly reading from and writing to many different Baofeng and other similar radios I have never bothered to set to volume to anything but just past the "click" that powers the radio on.

Hi Phil

And a Merry Christmas to you are yours.

Why do you hate us so much, that you are passing on to us a cable with known issues. No of course I am joking you don't hate us but I do suggest that you find a better use for the cable.

For example cut off the end, to its appropriate length, attach Anderson Power connectors to the free end and maybe you can use it as a charging cable.

Even with "free postage" it's hardly worth the haste and any one who knows how to deal with drivers, already have solved their issues.

But thanks and may the spirit of giving always fill your heart. It is with altruistic giving that a human can measure up to our Lord.

Happy New Year and 73

Wassim

Have you ever bought an FTDI cable? If you have the problem probably isn't the cable.Sometimes you have to trim the plug jacket to fit the UV-5R where it rubs. Or press in hard on the connector (usually for the same reason).

54469. Baofeng programming cable spoken for, more thoughts on 'my' cable problem

Yahoo group: baofeng_uv5r (2015)
Date: 2015-12-27 05:50:06 UTC
From: Phil
Topic: 54469 Message: 54469

This morning I posted that the cable is spoken for, but still getting inquiries.

I thought I was pretty computer savvy and more than a little familiar with driver installations etc. This Win7 machine has a LOT of USB ports, 8 factory USB2 ports and an added-on internal USB3 card to drive the USB3 hubs that the external drives and some other stuff runs off of. I made sure that I ALWAYS used the same port for the Baofeng cable but it still reloaded the later drivers after some time went by, disabling the Baofeng cable.

I think that the REAL problem just might be that I also have two 'real Prolific' USB/RS232 cables for CAT control of the Icom R-75 & Icom IC-735 rigs, not sure what the factory USB port on the IC-7200 really is, but it's also CAT controlled, as well as feeding audio over the same USB cable. . . A MINIMUM of two and sometimes 4 external hard drives (3TB each), a Softrock SDR receiver, TWO additional external Sound cards, keyboard/mouse are all running on various USB ports, all at the same time.

I suspect that there may be conflicts causing the problems I had with the 'fake' cable.

In any case the FTDI cable took care of the problems.

54470. Bad USB Hub/Replacement

Yahoo group: baofeng_uv5r (2015)
Date: 2015-12-27 13:03:58 UTC
From: cprendon@...
Topic: 54470 Message: 54470

I just had the usb hub that all my programming cables plugged into fail and I need to replacement. All my cables are genuine FTDI and they are for UV5R, UV3R (single pin) and FT60. I am running Win 7/64. My question is when I replace the hub and plug them back in will they automatically assign to the same comm ports or will I need to do something (not in the registry) to get them back where they were? The replacement hub will be different in all ways, manufacturer and number of ports. The old was a 4 port and the new will be a 7 port.

If not, is there a process for moderate level users to get things back where they were? Currently I can only see one of my cable's comm ports in device manager (LPT/COMM Ports) due to the failure so I don't know a way to delete the 2 devices which do not show. I could delete the one that shows so it starts clean. I know if I could see all of them I could simply delete then install them one by one and assign the same comm ports as previously. I just don't want the 3 old assignments left behind and 3 new ones created. I want to keep it clean.

They are most likely to change.Here's how to make them what you want.

Subject: [baofeng_uv5r] Bad USB Hub/Replacement

I just had the usb hub that all my programming cables plugged into fail and I need to replacement. All my cables are genuine FTDI and they are for UV5R, UV3R (single pin) and FT60. I am running Win 7/64. My question is when I replace the hub and plug them back in will they automatically assign to the same comm ports or will I need to do something (not in the registry) to get them back where they were? The replacement hub will be different in all ways, manufacturer and number of ports. The old was a 4 port and the new will be a 7 port.

If not, is there a process for moderate level users to get things back where they were? Currently I can only see one of my cable's comm ports in device manager (LPT/COMM Ports) due to the failure so I don't know a way to delete the 2 devices which do not show. I could delete the one that shows so it starts clean. I know if I could see all of them I could simply delete then install them one by one and assign the same comm ports as previously. Thanks Mike.

That link is basically what I found and I can delete the one which the system recognizes because it is currently live/shown. So I can delete/reassign that one. I am hoping to find a way to select the two which are currently hidden due to the bad hub ports and delete/reassign them, but I cannot find that procedure.

As I understand it if when installing an old cable as a new one on a different comm port, if I go into advanced and select the old comm port #, it will not let me delete the old comm port and assign this device to it. It will just show a conflict and refuse. I may just have to live with that. Every method I find to clean up unused comm ports requires going into regedit which I am NOT comfortable doing even if I back up the reg first. I try to run a clean ship/computer.

Hello, I am sure that bits of this have been covered, but I haven't seen them together and I am lousy at forums. So if this is a duplicate please pardon this message and point me to a good answer :)

I passed my tech, first got novice in '93. I have a Baofeng UV5R no pluses minuses bells or whistles. I bought the cord downloaded driver and chirp and drivers and got them running. Programmed names, repeaters offsets... I noticed after a good days use I wasn't hitting repeaters. I figured there might be a problem. I looked at menu and noticed offset was gone. I googled this and it said in memory mode you could not store offsets but there was something you could do about programming it twice. Could a name be programmed to this in chirp after? How do I do it start to finish? Does anyone have a good video?

Joe,

You are running to many things together and it is confusing you.

It is true, this radio does not store offsets in a memory channel. Shifts and Offsets are something that hams invented to reduce the number of switches and dials a radio needed back in the days before LCD displays and microprocessor. They could do this because the offset for ham repeaters is fairly standardized. But shifts and offsets have never been necessary. Back in the very early days you would by crystals. One for the TX frequency and one for the RX frequency.

These aren't ham radios, they are commercial radio used by hams because of; 1) their low cost, 2) they cover 2 ham bands without modification, and 3) their low cost. Commercial repeaters don't have standard offsets so it is just as easy to program the RX frequency and the TX frequency to get the job done (just like using crystals on the "old days".

That is how these radios work. When manually programming you program the RX frequency to and empty channel and then you program the TX frequency to the same channels as before. Because the radio programs this way, the indication that you will see in the upper status display is "+-". When you see this, you know that the RX frequency and TX frequency are different. This will happen for a repeater channel, a channel with an "odd split" or a channel that has TX inhibited.

When you program using CHIRP, you enter the RX frequency. Then the Duplex column you put the shift direction ("+" or "-") and finally in the Offset column you put the difference, or offset, in MHz that the TX frequency is from the RX frequency. Why? Because for some reason hams think this is the only way a radio can be programmed.

Then CHIRP uses these three values to calculate the TX frequency and sends it along with the RX frequency to the radio. Why? Because that what it requires.

Actually this won't work unless you have set the following environment variable.

set devmgr_show_nonpresent_devices = 1

You can do it at a command prompt, but I added it as a system variable
so I can view the hidden devices whenever I want.

Ya I found that out. View Hidden did nothing.

Does this setting remain in effect after reboot? If so, any ill effects to leaving it that way? I would LOVE to always be able to see hidden devices. If not I guess I could paste it under my keyboard... I did read that you can disable it by changing the switch to "0".

Thanks as always Jim

Thanks for taking the time to write this out! I was glad to see that in your chirp section I was actually doing it right... Or at least I think so. So I programmed it with chirp I entered rx, I did the duplex +,- and the offset which is 000.600. When I go to channel because I want to see names of repeater. I let up but nothing seems to happen. Granted I may be at fringe of repeater range. But when I was on channel mode I looked at values in offset category on radio itself it is not there 000.000 is all I see. I fix it and it is still gone lol. Should I assume that chirp did it right? And not stress about values being gone. I do actually get what the offsets accomplish it was just this part that had me confused. Thanks for your time!

When you transmit you should see the display frequency change to the offset frequency. Offsets are not stored in the radio. It's just a convenience for programming when repeater owners give offsets.

Yes. "Show Hidden Devices" is disabled after a reboot. But if you go
Advanced System Settings and add the "devmgr_show_nonpresent_devices"
environment variable to you System Environment Variables like I did,
you can enable "Show Hidden Devices" any time you wish.

Hi everyone! I am new to this forum. I got a uv-5r plus for Christmas and ran into these same issues in this thread. I decided to make a word document for myself to help me remember how to program it after time passes by and I forget how to do it again. I'm sharing it as an attachment here in case others run into the same problems. I have sent for the programming cable and software from Amazon but haven't received it yet so my radio was manually programmed in channel mode with 18 local repeaters and their working good.
 Thanks and 73, Mike, W4MK.

*see attachment (if you find any mistakes please let me know and I will fix it)

On Dec 28, 2015, at 8:11 AM, Black Michael mdblack98@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

  When you transmit you should see the display frequency change to the offset frequency. Offsets are not stored in the radio. It's just a convenience for programming when repeater owners give offsets.

  Thanks for taking the time to write this out! I was glad to see that in your chirp section I was actually doing it right... Or at least I think so. So I programmed it with chirp I entered rx, I did the duplex +,- and the offset which is 000.600. When I go to channel because I want to see names of repeater. I let up but nothing seems to happen.
 Granted I may be at fringe of repeater range. But when I was on channel mode I looked at values in offset category on radio itself it is not there 000.000 is all I see. I fix it and it is still gone lol. Should I assume that chirp did it right? And not stress about values being gone. I do actually get what the offsets accomplish it was just this part that had me confused. Thanks for your time!73 Joe

  Joe,

You are running to many things together and it is confusing you.

It is true, this radio does not store offsets in a memory channel.
Shifts and Offsets are something that hams invented to reduce the
number of switches and dials a radio needed back in the days before
LCD displays and microprocessor. They could do this because the offset
for ham repeaters is fairly standardized. But shifts and offsets have

never been necessary. Back in the very early days you would by crystals. One for the TX frequency and one for the RX frequency.

These aren't ham radios, they are commercial radio used by hams because of; 1) their low cost, 2) they cover 2 ham bands without modification, and 3) their low cost. Commercial repeaters don't have standard offsets so it is just as easy to program the RX frequency and the TX frequency to get the job done (just like using crystals on the "old days".

That is how these radios work. When manually programming you program the RX frequency to and empty channel and then you program the TX frequency to the same channels as before. Because the radio programs this way, the indication that you will see in the upper status display is "+-". When you see this, you know that the RX frequency and TX frequency are different. This will happen for a repeater channel, a channel with an "odd split" or a channel that has TX inhibited.

When you program using CHIRP, you enter the RX frequency. Then the Duplex column you put the shift direction ("+" or "-") and finally in the Offset column you put the difference, or offset, in MHz that the TX frequency is from the RX frequency. Why? Because for some reason hams think this is the only way a radio can be programmed.

Then CHIRP uses these three values to calculate the TX frequency and sends it along with the RX frequency to the radio. Why? Because that what it requires.

I agree 100%.
The scan speed is way to slow.
Scanning stops on any carrier or noise even in PL/DPL decode.
No programmable limit search.
No selectable delay time.
No way to add or remove channels from the scan list unless you use software.
No lockout or nuisance delete.
No priority.

Tom

Its good enough for me. I just like to listen to Police and Fire. I used the TDC (right??) setting so it scans the two banks back and forth. It’s a single radio solution. I have been using my handheld for monitoring public safety bands for decades now, even though I have several scanners.

I actually use me UV-5RA and my 2 UV-82's along with the scanners I have. If something happens instead of locking the scanner on it I just put the portable on the channel and use the scanners to scan. It makes a nice little radio for doing that and serves me right. You are never going to get a transeiver to get the scan rate a regular scanner gets. just not gonna happen they aren't built for that.

Uh. There is only one bank. You are scanning each frequency in the radio in numerical order in the vfo you have selected.
The second vfo only comes into play if the frequency it is set to becomes active. I'm not even sure that happens if it is in scan.

I have police programmed on ch 8, fire on channel 9. I change a TDR, setting 7, to on. I set a bank to 8, b to 9, so they both show on display. I will switch between those two channels till there is action on one, then stay on it till it is quiet.

I use mine in a similar way on the frequency mode with two local repeaters programmed into A/B with TDR set to on. When either one becomes active it receives the transmission. No scanning involved, just monitoring my two favorite local nets.

The feature is TDR (Transceiver Dual Receive). When TDR is set to ON the radio scans between what is selected in the top (A) display line and bottom (B) display line. This will be the 2 selected frequencies if the radio is in VFO (frequency) mode or 2 selected channels if the radio is in MR (channel) mode.

These radios only have a single "bank" of 128 channels. No matter if you are scrolling through the A display line or B display line, you are scrolling through the same 128 channels.

And unless the behavior has been recently changed, when you press and hold the [*] key to initiate scanning, TDR is disabled during the time the selected display line is scanning.

You are using the term "bank" incorrectly. It is the A display line
and the B display line. Then each display line can access the same
"bank" of 128 channels.

You are basically correct. But if the selected frequency or channel has menu 10 (R-DCS) or menu 11 (R-CTCS) enabled, then it will take a "carrier + matching DCS code" or "carrier + matching CTCSS tone" before the receiver will "lock in". A "carrier" by itself would be ignored.

That's not true unless they changed the firmware recently.
Scanning and TDR stops on any carrier or noise that is strong enough to open the squelch.

Program a NOAA weather channel with PL or DCS decode and see if you ever hear anything else.

TDR will stop on the weather channel, the busy (green) LED will light up, and it will stay there.

Memory scan will stop on the weather channel the busy (green) LED will light up and stay there unless you have Menu 18 SC-REV set to TO (time operated) then it will remain for the timeout time and then repeat the process.

On the A line, I have a short description of what it is, the B line is the frequency.

You are using the term "bank" incorrectly. It is the A display line
and the B display line. Then each display line can access the same
"bank" of 128 channels.

If you think about it, setting TDR to ON is scanning. The radio only has a single receiver. So when TDR is ON, the radio scans between the frequency/channel that is selected in the A display line and the B display line. It is just a different type of scanning than what you get when you press and hold the [*] key.

Jim,

In one weird sense, I think the UV-5R does have two "banks" of memories. If your two memories (that you wish to scan) are on VFO A and VFO B, turning TDR to "ON" would ONLY scan those two frequencies (thus a bank of two), while turning on the primary scanning function using the " * " key would scan up to 128 memories (or one bank of up to 128).

With UV-5R's being so cheap, it's certainly possible that various individuals "could" buy several radios and program them differently, thus achieving about 4 channels per second with two radios, about 6 channels per second with three radios, etc., etc. - not very cost effective I grant you, but unless they are willing to purchase a real scanner, it's about the only way I know to speed up the s-l-o-w scanning rate of the UV-5R radio.

That's fine, so long as you keep manually setting both display lines to the same memory channel.

I have 2 HT's, one is an Icom IC-T81a Quad Band and the other is the UV5R+ Dual Band, both seem to scan in channel mode about the same speed. The way I like to scan is to setup all my local repeaters (18 of them) into the channel mode on the UV5R and set it to the B bank where it shows the frequencies of each one with TDR set to CO. It runs through the 18 memories in about 3-4 seconds and if it detects an active repeater it stops for the carrier length then resumes. I never miss much activity this way. Both radios performance is very similar in the scanning mode.

54509. CHIRP Error

Yahoo group: baofeng_uv5r (2015)
Date: 2015-12-31 20:06:54 UTC
From: dtgolder@...
Topic: 54509 Message: 54509

Hi all,

Am getting the following error when using CHIRP:

Error setting memory: Frequency 135.075000 is out of supported range

I programmed 135.075 manually (frequency mode) as it's the weather beacon from our local airport. I then manually set this to memory channel 0.

But now when I want to change the "Name" field I get the above error--any ideas on how to resolve?

Thanks!

This is because the CHIRP driver for Baofeng UV-5R is set to the original factory limits of 136-174 MHz and 400-520 MHz. The recent radios have been shipping with the HF band limits set to 130-179 MHz. Open an issue and I will look into opening the supported frequency range to the currently shipping band limits.

Try programming it in manually. That frequency is out of the Baofengs normal range and is an airband frequency. Probably should be AM, also, which the Baofengs cannot do. But, if it worked for you manually, try it again.
